Abstract

The DAKOTA (Design Analysis Kit for Optimization and Terascale Applications) toolkit provides a flexible and extensible interface between simulation codes and iterative analysis methods. DAKOTA contains algorithms for optimization with gradient and nongradient-based methods; uncertainty quantification with sampling, reliability, and stochastic finite element methods; parameter estimation with nonlinear least squares methods; and sensitivity/variance analysis with design of experiments and parameter study methods. These capabilities may be used on their own or as components within advanced strategies such as surrogate-based optimization, mixed integer nonlinear programming, or optimization under uncertainty. By employing object-oriented design to implement abstractions of the key components required for iterative systems analyses, the DAKOTA toolkit provides a flexible and extensible problem-solving environment for design and performance analysis of computational models on high performance computers.

This report serves as a developers manual for the DAKOTA software and describes the DAKOTA class hierarchies and their interrelationships. It derives directly from annotation of the source code and provides detailed class documentation, including all member functions and attributes.

DAKOTA Developers Manual

Author:
Brian M. Adams, William J. Bohnhoff, Keith R. Dalbey, John P. Eddy, Michael S. Eldred, David M. Gay, Karen Haskell, Patricia D. Hough, Sophia Lefantzi, Laura P. Swiler

1.1 Introduction

The DAKOTA (Design Analysis Kit for Optimization and Terascale Applications) toolkit provides a flexible, extensible interface between analysis codes and iteration methods. DAKOTA contains algorithms for optimization with gradient and non-gradient-based methods, uncertainty quantification with sampling, reliability, stochastic expansion, and interval estimation methods, parameter estimation with nonlinear least squares methods, and sensitivity/variance analysis with design of experiments and parameter study capabilities. (Solution verification and Bayesian approaches are also in development.) These capabilities may be used on their own or as components within advanced algorithms such as surrogate-based optimization, mixed integer nonlinear programming, mixed aleatory-epistemic uncertainty quantification, or optimization under uncertainty. By employing object-oriented design to implement abstractions of the key components required for iterative systems analyses, the DAKOTA toolkit provides a flexible problem-solving environment as well as a platform for rapid prototyping of new solution approaches.

The Developers Manual focuses on documentation of DAKOTA class structures; it derives directly from annotation of the source code. For information on input command syntax, refer to the Reference Manual, and for a tour of DAKOTA features and capabilities, refer to the Users Manual.

1.2 Overview of DAKOTA

In DAKOTA, the strategy creates and manages iterators and models. In the simplest case, the strategy creates a single iterator and a single model and executes the iterator on the model to perform a single study. In a more advanced case, a hybrid optimization strategy might manage a global optimizer operating on a low-fidelity model in coordination with a local optimizer operating on a high-fidelity model. And on the high end, a surrogate-based optimization under uncertainty strategy would employ an uncertainty quantification iterator nested within an optimization iterator and would employ truth models layered within surrogate models. Thus, iterators and
models provide both stand-alone capabilities as well as building blocks for more sophisticated studies.

A model contains a set of variables, an interface, and a set of responses, and the iterator operates on the model to map the variables into responses using the interface. Each of these components is a flexible abstraction with a variety of specializations for supporting different types of iterative studies. In a DAKOTA input file, the user specifies these components through strategy, method, model, variables, interface, and responses keyword specifications.

The use of class hierarchies provides a mechanism for extensibility in DAKOTA components. In each of the various class hierarchies, adding a new capability typically involves deriving a new class and providing a small number of virtual function redefinitions. These redefinitions define the coding portions specific to the new derived class, with the common portions already defined at the base class. Thus, with a small amount of new code, the existing facilities can be extended, reused, and leveraged for new purposes.

The software components are presented in the following sections using a top-down order.

1.2.1 Strategies

Class hierarchy: Strategy.

Strategies provide a control layer for creation and management of iterators and models. Specific strategies include:

- SingleMethodStrategy: the simplest strategy. A single iterator is run on a single model to perform a single study.

- HybridStrategy: hybrid minimization using a set of iterators employing a corresponding set of models of varying fidelity. Coordination approaches among the iterators include collaborative, embedded, and sequential approaches, as embodied in the CollaborativeHybridStrategy, EmbeddedHybridStrategy, and SequentialHybridStrategy derived classes.

- ConcurrentStrategy: two similar algorithms are available: (1) multi-start iteration from several different starting points, and (2) pareto set optimization for several different multiobjective weightings. Employs a single iterator with a single model, but runs multiple instances of the iterator concurrently for different settings within the model.

1.2.2 Iterators

Class hierarchy: Iterator. Iterator implementations may choose to split operations up into run time phases as described in Understanding Iterator Flow.

The iterator hierarchy contains a variety of iterative algorithms for optimization, uncertainty quantification, non-linear least squares, design of experiments, and parameter studies. The hierarchy is divided into Minimizer and Analyzer branches. The Minimizer classes include:

- Optimization: Optimizer provides a base class for the DOTOptimizer, CONMINOptimizer, NPSOLOptimizer, NLPQLPOptimizer, and SNLOptimizer gradient-based optimization libraries and the APPSOptimizer, COLINOptimizer, JEGAOptimizer, and NCSUOptimizer nongradient-based optimization methods and libraries.

- Parameter estimation: LeastSq provides a base class for NL2SOLLeastSq, a least-squares solver based on NL2SOL, SNLLLeastSq, a Gauss-Newton least-squares solver, and NLSSOLLeastSq, an SQP-based least-squares solver.
1.2 Overview of DAKOTA

- Surrogate-based minimization (optimization and nonlinear least squares): SurrBasedMinimizer provides a base class for SurrBasedLocalMinimizer, SurrBasedGlobalMinimizer, and EffGlobalMinimizer. The surrogate-based local and global methods employ a single iterator with any of the available SurrogateModel capabilities (local, multipoint, or global data fits or hierarchical approximations) and perform a sequence of approximate optimizations, each involving build, optimize, and verify steps. The efficient global method, on the other hand, hard-wires a recursion involving Gaussian process surrogate models coupled with the DIRECT global optimizer to maximize an expected improvement function.

and the Analyzer classes include:

- Uncertainty quantification: NonD provides a base class for non-deterministic methods NonDSampling, NonDReliability (reliability analysis), NonDExpansion (stochastic expansion methods), NonDIntegration (numerical integration methods), and NonDInterval (interval-based epistemic methods). Bayesian calibration methods are prototyped in NonDBayesCalibration. At this point, we have an initial implementation of the LANL GPMSA code in NonDGPMABayesianCalibration.
  
  - NonDSampling is further specialized with the NonDLHSSampling class for Latin hypercube and Monte Carlo sampling, the NonDIncremLHSSampling class for incremental Latin hypercube sampling, and NonDAdaptImpSampling for multimodal adaptive importance sampling.
  
  - NonDReliability is further specialized with local and global methods (NonDLocalReliability and NonDGGlobalReliability).
  
  - NonDExpansion includes specializations for generalized polynomial chaos (NonDPolynomialChaos) and stochastic collocation (NonDStochCollocation) and is supported by NonDIntegration, which supplies cubature, tensor-product quadrature and Smolyak sparse grid methods (NonDCubature, NonDQuadrature, and NonDSparseGrid).
  
  - NonDInterval provides a base class for epistemic interval-based UQ methods. Three interval analysis approaches are provided: LHS (NonDLHSInterval), efficient global optimization (NonDGInterval), and local optimization (NonDLocalInterval). Each of these three has specializations for single interval (NonDLHSSingleInterval, NonDGGlobalSingleInterval, NonDLocalSingleInterval) and Dempster-Shafer Theory of Evidence (NonDLHSEvidence, NonDGGlobalEvidence, NonDLocalEvidence) approaches.

- Parameter studies and design of experiments: PStudyDACE provides a base class for ParamStudy, which provides capabilities for directed parameter space interrogation, PSUADesignCompExp, which provides access to the Morris One-At-a-Time (MOAT) method for parameter screening, and DDACEDesignCompExp and FSUDesignCompExp, which provide for parameter space exploration through design and analysis of computer experiments. NonDLHSSampling from the uncertainty quantification branch also supports design of experiments for design and state variables when in all_variables mode.

- Solution verification studies: Verification provides a base class for the active RichExtrapVerification (verification via Richardson extrapolation) and other solution verification methods in development.

1.2.3 Models

Class hierarchy: Model.

The model classes are responsible for mapping variables into responses when an iterator makes a function evaluation request. There are several types of models, some supporting sub-iterators and sub-models for enabling layered and nested relationships. When sub-models are used, they may be of arbitrary type so that a variety of recursions are supported.
- **SingleModel**: variables are mapped into responses using a single Interface object. No sub-iterations or sub-models are used.

- **SurrogateModel**: variables are mapped into responses using an approximation. The approximation is built and/or corrected using data from a sub-model (the truth model) and the data may be obtained using a sub-iterator (a design of experiments iterator). SurrogateModel has two derived classes: DataFitSurrModel for data fit surrogates and HierarchSurrModel for hierarchical models of varying fidelity. The relationship of the sub-iterations and sub-models is considered to be "layered" since they are not used as part of every response evaluation on the top level model, but rather used periodically in surrogate update and verification steps.

- **NestedModel**: variables are mapped into responses using a combination of an optional Interface and a sub-iterator/sub-model pair. The relationship of the sub-iterations and sub-models is considered to be "nested" since they are used to perform a complete iterative study as part of every response evaluation on the top level model.

- **RecastModel**: recasts the inputs and outputs of a sub-model for the purposes of variable transformations (e.g., variable scaling, transformations to standardized random variables) and problem reformulation (e.g., multiobjective optimization, response scaling, augmented Lagrangian merit functions, expected improvement).

### 1.2.4 Variables

Class hierarchy: **Variables**.

The Variables class hierarchy manages design, aleatory uncertain, epistemic uncertain, and state variable types for continuous, discrete integer, and discrete real domain types. This hierarchy is specialized according to how the domain types are managed:

- **MixedVariables**: domain type distinctions are retained, such that separate continuous, discrete integer, and discrete real domain types are managed. This is the default Variable perspective, and draws its name from "mixed continuous-discrete" optimization.

- **MergedVariables**: domain types are combined through relaxation of discrete constraints; i.e., continuous and discrete variables are merged into continuous arrays through relaxation of integrality (for discrete integer ranges) or set membership (for discrete integer or discrete real sets) requirements. The branch and bound minimizer is the only method using this approach at present.

Whereas domain types are controlled through the derived class selection, variable types are handled within each of these derived classes using variable views. These views control the subset of variable types that are active and inactive within a particular iterative study. For design optimization and uncertainty quantification, for example, the active variables view consists of design or uncertain types, respectively, and any other variable types are carried along invisible to the iterative algorithm being employed. For parameter studies and design of experiments, however, a variable subset view is not imposed and all variables are active. Selected uncertainty quantification methods can also be toggled into an "All" view using the all_variables input specification.

Any inactive view is set based on higher level iteration within a model recursion (e.g., a NestedModel), which enables lower level iteration to return derivatives with respect to variables that are active at the higher level.

The **Constraints** hierarchy manages bound, linear, and nonlinear constraints and utilizes the same specializations for managing bounds on the variables (see MixedConstraints and MergedConstraints).
1.2 Overview of DAKOTA

1.2.5 Interfaces

Class hierarchy: Interface.

Interfaces provide access to simulation codes or, conversely, approximations based on simulation code data. In the simulation case, an ApplicationInterface is used. ApplicationInterface is specialized according to the simulation invocation mechanism, for which the following nonintrusive approaches are supported. Scheduling of jobs for asynchronous local, message passing, and hybrid parallelism approaches is performed in the ApplicationInterface class, with job initiation and job capture specifics implemented in the derived classes.

- **SysCallApplicInterface**: the simulation is invoked using a system call (the C function `system()`). Asynchronous invocation utilizes a background system call. Utilizes the SysCallAnalysisCode class to define syntax for input filter, analysis code, output filter, or combined spawning, which in turn utilize the CommandShell utility.

- **ForkApplicInterface**: the simulation is invoked using a fork (the `fork/exec/wait` family of functions). Asynchronous invocation utilizes a nonblocking fork. Utilizes the ForkAnalysisCode class for lower level fork operations.

- **GridApplicInterface**: the simulation is invoked using distributed resource facilities. This capability is experimental and still under development. The design is evolving into the use of Condor and/or Globus tools.

and the following semi-intrusive approach

- **DirectApplicInterface**: the simulation is linked into the DAKOTA executable and is invoked using a procedure call. Asynchronous invocations will utilize nonblocking threads (capability not yet available).

In the approximation case, global, multipoint, or local data fit approximations to simulation code response data can be built and used as surrogates for the actual, expensive simulation. The interface class providing this capability is

- **ApproximationInterface**: builds an approximation using data from a truth model and then employs the approximation for mapping variables to responses. This class contains an array of Approximation objects, one per response function, which support a variety of approximation types using the different Approximation derived classes. These include SurfpackApproximation (provides kriging, MARS, moving least squares, neural network, polynomial regression, and radial basis functions), GaussProcApproximation (Gaussian process models), PecosApproximation (multivariate orthogonal and Lagrange interpolation polynomials from Pecos), TANA3Approximation (two-point adaptive nonlinearity approximation), and TaylorApproximation (local Taylor series).

which is an essential component within the DataFitSurrModel capability described above in Models.

1.2.6 Responses

Class: Response.

The Response class provides an abstract data representation of response functions and their first and second derivatives (gradient vectors and Hessian matrices). These response functions can be interpreted as an objective
function and constraints (optimization data set), residual functions and constraints (least squares data set), or
generic response functions (uncertainty quantification data set). This class is not currently part of a class hierarchy,
since the abstraction has been sufficiently general and has not required specialization.

1.3 Services

A variety of services are provided in DAKOTA for parallel computing, failure capturing, restart, graphics, etc. An
overview of the classes and member functions involved in performing these services is included below.

- Multilevel parallel computing: DAKOTA supports multiple levels of nested parallelism. A strategy can
  manage concurrent iterators, each of which manages concurrent function evaluations, each of which man-
  ages concurrent analyses executing on multiple processors. Partitioning of these levels with MPI communic-
  ators is managed in ParallelLibrary and scheduling routines for the levels are part of Strategy, Application-
  Interface, and ForkApplicInterface.

- Parsing: DAKOTA employs the NIDR parser (New Input Deck Reader) to retrieve information from user
  input files. Parsing options are processed in CommandLineHandler and parsing occurs in ProblemDesc-
  DB::manage_inputs() called from main.C. NIDR uses the keyword handlers in the NIDRProblemDesc-
  DB derived class to populate data within the ProblemDescDB base class, which maintains a DataStrategy
  specification and lists of DataMethod, DataModel, DataVariables, DataInterface, and DataResponses spec-
  ifications. Procedures for modifying the parsing subsystem are described in Instructions for Modifying
  DAKOTA’s Input Specification.

- Failure capturing: Simulation failures can be trapped and managed using exception handling in Application-
  Interface and its derived classes.

- Restart: DAKOTA maintains a record of all function evaluations both in memory (for capturing any
  duplication) and on the file system (for restarting runs). Restart options are processed in CommandLineHandler
  and retrieved in ParallelLibrary::specify_outputs_restart(), restart file management occurs in
  ParallelLibrary::manage_outputs_restart(), and restart file insertions occur in ApplicationInterface. The
  dakota_restart_util executable, built from restart_util.C, provides a variety of services for interro-
  gating, converting, repairing, concatenating, and post-processing restart files.

- Memory management: DAKOTA employs the techniques of reference counting and representation sharing
  through the use of letter-envelope and handle-body idioms (Coplien, "Advanced C++"). The former idiom
  provides for memory efficiency and enhanced polymorphism in the following class hierarchies: Strategy,
  Iterator, Model, Variables, Constraints, Interface, ProblemDescDB, and Approximation. The latter id-
  iom provides for memory efficiency in data-intensive classes which do not involve a class hierarchy. The
  Response, parser data (DataStrategy, DataMethod, DataModel, DataVariables, DataInterface, and Data-
  Responses) classes use this idiom. When managing reference-counted data containers (e.g., Variables or
  Response objects), it is important to properly manage shallow and deep copies, to allow for both efficiency
  and data independence as needed in a particular context.

- Graphics: DAKOTA provides 2D iteration history graphics using Motif widgets. Graphics data can also be
  catalogued in a tabular data file for post-processing with 3rd party tools such as Matlab, Tecplot, etc. These
  capabilities are encapsulated within the Graphics class.
1.4 Additional Resources

Additional development resources include:

- Recommended Practices for DAKOTA Development
- Software Tools for DAKOTA Development
- Instructions for Modifying DAKOTA’s Input Specification
- Understanding Iterator Flow
- Interfacing with DAKOTA as a Library

The execution of function evaluations is a core component of DAKOTA involving several class hierarchies. An overview of the classes and member functions involved in performing these evaluations is provided in Performing Function Evaluations.

DAKOTA Class Index

4.1 DAKOTA Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

- **ActiveSet** (Active set request vector and the derivative variables vector) ......................................................... 167
- **AnalysisCode** (Processes for managing simulations) .................................................................................. 170
- **Analyzer** (Hierarchy) ........................................................................................................................................ 175
- **ApplicationInterface** (Interfaces to simulation codes) .................................................................................. 180
- **Approximation** (Base class for the approximation class hierarchy) ......................................................... 191
- **ApproximationInterface** (Approximations to simulation-based results) ...................................................... 199
- **APPSEvalMgr** (Evaluation manager class for APPSPACK) ............................................................................. 204
- **APPSOptimizer** (Wrapper class for APPSPACK) .......................................................................................... 207
- **BaseConstructor** (Dummy struct for overloading letter-envelope constructors) .............................................. 210
- **BiStream** (Data types) ........................................................................................................................................ 211
- **BoStream** (Data types) ....................................................................................................................................... 214
- **COLINApplication** .............................................................................................................................................. 217
- **COLINOptimizer** (Wrapper class for optimizers defined using COLIN) ............................................................ 220
- **CollaborativeHybridStrategy** (Optimization and nonlinear least squares methods) ...................................... 223
- **CommandLineHandler** (Utility class for managing command line inputs to DAKOTA) ........................................ 225
- **CommandShell** (Processes with system calls) .............................................................................................. 227
- **ConcurrentStrategy** (Strategy for multi-start iteration or pareto set optimization) ............................................ 229
- **CONMINOptimizer** (Wrapper class for the CONMIN optimization library) .................................................... 232
- **Constraints** (Base class for the variable constraints class hierarchy) ............................................................ 240
- **CtelRegexp** ......................................................................................................................................................... 252
- **DataFitSurrModel** (Data fit surrogates (global and local)) .............................................................................. 255
- **DataInterface** (Handle class for interface specification data) ............................................................................. 265
- **DataMethod** (Handle class for method specification data) ................................................................................ 267
- **DataMethodRep** (Body class for method specification data) .............................................................................. 269
- **DataModel** (Handle class for model specification data) ................................................................................... 282
- **DataModelRep** (Body class for model specification data) ................................................................................... 284
- **DataResponses** (Handle class for responses specification data) ................................................................. 288
- **DataResponsesRep** (Body class for responses specification data) ............................................................... 290
- **DataStrategy** (Handle class for strategy specification data) .............................................................................. 294

**4.1 DAKOTA Class List**

- NonDCubature (Numerical cubature points for evaluation of expectation integrals)
- NonDExpansion (Collocation (SC))
- NonDGlobalEvidence (Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ)
- NonDGlobalInterval (To calculate interval bounds for epistemic uncertainty quantification)
- NonDGlobalReliability (Class for global reliability methods within DAKOTA/UQ)
- NonDGlobalSingleInterval (To calculate interval bounds for epistemic uncertainty quantification)
- NonDGPMSSBayesCalibration (Generates posterior distribution on model parameters given experimental data)
- NonDIncrementLHSSampling (Performs incremental LHS sampling for uncertainty quantification)
- NonDIntegration (Numerical integration points for evaluation of expectation integrals)
- NonDInterval (Base class for interval-based methods within DAKOTA/UQ)
- NonDLHSEvidence (Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ)
- NonDLocalInterval (Class for the LHS-based interval methods within DAKOTA/UQ)
- NonDLHSSampling (Performs LHS and Monte Carlo sampling for uncertainty quantification)
- NonDLocalSingleInterval (Class for pure interval propagation using LHS)
- NonDLocalEvidence (Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ)
- NonDLocalInterval (Calculate interval bounds for epistemic uncertainty quantification)
- NonDLocalReliability (Class for the reliability methods within DAKOTA/UQ)
- NonDLocalSingleInterval (Calculate interval bounds for epistemic uncertainty quantification)
- NonDPolynomialChaos (Quantification)
- NonDQuadrature (Normals/uniforms/exponentials/betas/gammas)
- NonDQUESOBayesCalibration (Bayesian inference using the QUESO library from UT Austin)
- NonDReliability (Base class for the reliability methods within DAKOTA/UQ)
- NonDSampling (NonDIncrementLHSSampling, and NonDAadaptImpSampling)
- NonDSparseGrid (Integrals over independent standard random variables)
- NonDStochasticCollocation (Quantification)
- NPSOLOptimizer (Wrapper class for the NPSOL optimization library)
- Optimizer (Base class for the optimizer branch of the iterator hierarchy)
- ParallelConfiguration (Collectively identify a particular multilevel parallel configuration)
- ParallelDirectApplicInterface (Plug-ins using assign_rep)
- ParallelLevel (Communicator partitioning)
- ParallelLibrary (Message passing within these levels)
- ParamResponsePair (Evaluation id)
- ParamStudy (Class for vector, list, centered, and multidimensional parameter studies)
- partial_prp_equality (Predicate for comparing ONLY the idInterface and Vars attributes of PRPair)
- partial_prp_hash (Wrapper to delegate to the ParamResponsePair hash_value function)
- PecosApproximation (Derived approximation class for global basis polynomials)
- ProblemDescDB (The database containing information parsed from the DAKOTA input file)
- PStudyDACE (Design of experiments methods)
- PSUADEDesignCompExp (Wrapper class for the PSUADE library)
- RecastBaseConstructor (Instantiations)
- RecastModel (In order to recast the form of its inputs and/or outputs)
- Response (Response provides the handle class)
- ResponseRep (ResponseRep provides the body class)
- RichExtrapVerification (Class for Richardson extrapolation for code and solution verification)
- SensAnalysisGlobal (And variance-based decomposition)
- SequentialHybridStrategy (Models of varying fidelity)
- SerialDirectApplicInterface (Plug-ins using assign_rep)
- SharedVariablesData (Among a set of Variables instances)

**DAKOTA Class Index**

*DAKOTA Version 5.1 Developers Manual generated on January 21, 2011*
Chapter 5

DAKOTA File Index

5.1 DAKOTA File List

Here is a list of all documented files with brief descriptions:

- dll_api.C (This file contains a DakotaRunner class, which launches DAKOTA) ........................................ 757
- dll_api.h (API for DLL interactions) ........................................ 759
- JEGAOptimizer.C (Contains the implementation of the JEGAOptimizer class) ........................................ 761
- JEGAOptimizer.H (Contains the definition of the JEGAOptimizer class) ........................................ 762
- library_mode.C (File containing a mock simulator main for testing DAKOTA in library mode) ........ 763
- library_split.C (File containing a mock simulator main for testing DAKOTA in library mode on a split communicator) ........................................ 765
- main.C (File containing the main program for DAKOTA) ........................................ 766
- restart_util.C (File containing the DAKOTA restart utility main program) ........................................ 767
Chapter 6

DAKOTA Page Index

6.1  DAKOTA Related Pages

Here is a list of all related documentation pages:

- Recommended Practices for DAKOTA Development ........................................ 769
- Instructions for Modifying DAKOTA’s Input Specification ............................... 773
- Understanding Iterator Flow ........................................................................... 779
- Interfacing with DAKOTA as a Library ............................................................. 781
- Performing Function Evaluations ................................................................... 791
- Software Tools for DAKOTA Development ..................................................... 793
- Todo List .......................................................................................................... ??
Chapter 7

DAKOTA Namespace Documentation

7.1 Dakota Namespace Reference

The primary namespace for DAKOTA.

Classes

- class `AnalysisCode`
  processes for managing simulations.

- class `ApplicationInterface`
  interfaces to simulation codes.

- class `ApproximationInterface`
  approximations to simulation-based results.

- class `APPSEvalMgr`
  Evaluation manager class for APPSPACK.

- class `APPSOptimizer`
  Wrapper class for APPSPACK.

- class `COLINAApplication`
- class `COLINOptimizer`
  Wrapper class for optimizers defined using COLIN.

- class `CollaborativeHybridStrategy`
  optimization and nonlinear least squares methods.

- class `GetLongOpt`
  (Advanced Computer Research Institute, Lyon, France).
• class **CommandLineHandler**  
  Utility class for managing command line inputs to DAKOTA.

• class **CommandShell**  
  processes with system calls.

• class **ConcurrentStrategy**  
  Strategy for multi-start iteration or pareto set optimization.

• class **CONMINOptimizer**  
  Wrapper class for the CONMIN optimization library.

• class **ActiveSet**  
  active set request vector and the derivative variables vector.

• class **Analyzer**  
  hierarchy.

• class **Approximation**  
  Base class for the approximation class hierarchy.

• class **BiStream**  
  data types

• class **BoStream**  
  data types

• class **Constraints**  
  Base class for the variable constraints class hierarchy.

• class **Graphics**  
  for post-processing with Matlab, Tecplot, etc.

• class **Interface**  
  Base class for the interface class hierarchy.

• class **Iterator**  
  Base class for the iterator class hierarchy.

• class **LeastSq**  
  Base class for the nonlinear least squares branch of the iterator hierarchy.

• class **Minimizer**  
  iterator hierarchy.
class Model
   Base class for the model class hierarchy.

class NonD
   Base class for all nondeterministic iterators (the DAKOTA/UQ branch).

class Optimizer
   Base class for the optimizer branch of the iterator hierarchy.

class PStudyDACE
   Design of experiments methods.

class ResponseRep
   ResponseRep provides the body class.

class Response
   Response provides the handle class.

class Strategy
   Base class for the strategy class hierarchy.

class String
   Dakota::String class, used as main string class for Dakota.

class Variables
   Base class for the variables class hierarchy.

class Verification
   Base class for managing common aspects of verification studies.

class DataFitSurrModel
   data fit surrogates (global and local)

class DataInterface
   Handle class for interface specification data.

class DataMethodRep
   Body class for method specification data.

class DataMethod
   Handle class for method specification data.

class DataModelRep
   Body class for model specification data.

class DataModel
Handle class for model specification data.

- class **DataResponsesRep**  
  Body class for responses specification data.

- class **DataResponses**  
  Handle class for responses specification data.

- class **DataStrategyRep**  
  Body class for strategy specification data.

- class **DataStrategy**  
  Handle class for strategy specification data.

- class **DataVariablesRep**  
  Body class for variables specification data.

- class **DataVariables**  
  Handle class for variables specification data.

- class **DDACEDesignCompExp**  
  Wrapper class for the DDACE design of experiments library.

- class **DirectApplicInterface**  
  and testers using direct procedure calls.

- class **DOTOptimizer**  
  Wrapper class for the DOT optimization library.

- class **EffGlobalMinimizer**  
  Implementation of Efficient Global Optimization/Least Squares algorithms.

- class **EmbeddedHybridStrategy**  
  search methods.

- class **ForkAnalysisCode**  
  simulations using forks.

- class **ForkApplicInterface**  
  using forks.

- class **FSUDesignCompExp**  
  Wrapper class for the FSUDace QMC/CVT library.

- class **GaussProcApproximation**  
  Derived approximation class for Gaussian Process implementation.
- **struct** `BaseConstructor`  
  Dummy struct for overloading letter-envelope constructors.

- **struct** `NoDBBaseConstructor`  
  Dummy struct for overloading constructors used in on-the-fly instantiations.

- **struct** `RecastBaseConstructor`  
  instantiations.

- **class** `GridApplicInterface`  
  using grid services such as Condor or Globus.

- **class** `HierarchSurrModel`  
  hierarchical surrogates (models of varying fidelity).

- **class** `HybridStrategy`  
  Base class for hybrid minimization strategies.

- **class** `JEGAOptimizer`  
  A version of `Dakota::Optimizer` for instantiation of John Eddy’s Genetic Algorithms (JEGA).

- **class** `MergedConstraints`  
  the merged data view.

- **class** `MergedVariables`  
  merged data view.

- **class** `MixedConstraints`  
  the default data view (no variable or domain type array merging).

- **class** `MixedVariables`  
  the default data view (no variable or domain type array merging).

- **class** `MPIPackBuffer`  
  Class for packing MPI message buffers.

- **class** `MPIUnpackBuffer`  
  Class for unpacking MPI message buffers.

- **class** `NCSUOptimizer`  
  Wrapper class for the NCSU DIRECT optimization library.

- **class** `NestedModel`  
  execution within every evaluation of the model.
- class **NIDRProblemDescDB**
  The derived input file database utilizing the new IDR parser.

- struct **NL2Res**
  Auxiliary information passed to calcr and calcj via ur.

- class **NL2SOLLeastSq**
  Wrapper class for the NL2SOL nonlinear least squares library.

- class **NLPQLPOptimizer**
  Wrapper class for the NLPQLP optimization library, Version 2.0.

- class **NLSSOLLeastSq**
  Wrapper class for the NLSSOL nonlinear least squares library.

- class **NonDAdaptImpSampling**
  Class for the Adaptive Importance Sampling methods within DAKOTA.

- class **NonDBayesCalibration**
  distribution on model parameters given experimental data

- class **NonDCalibration**

- class **NonDCubature**
  numerical cubature points for evaluation of expectation integrals.

- class **NonDExpansion**
  collocation (SC)

- class **NonDGlobalEvidence**
  Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.

- class **NonDGlobalInterval**
  to calculate interval bounds for epistemic uncertainty quantification

- class **NonDGlobalReliability**
  Class for global reliability methods within DAKOTA/UQ.

- class **NonDGlobalSingleInterval**
  to calculate interval bounds for epistemic uncertainty quantification

- class **NonDGPMSSABayesCalibration**
  Generates posterior distribution on model parameters given experiment data.

- class **NonDIncremLHSSampling**
  Performs incremental LHS sampling for uncertainty quantification.
• class NonDIntegration  
  numerical integration points for evaluation of expectation integrals

• class NonDInterval  
  Base class for interval-based methods within DAKOTA/UQ.

• class NonDLHSEvidence  
  Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.

• class NonDLHSInterval  
  Class for the LHS-based interval methods within DAKOTA/UQ.

• class NonDLHSSampling  
  Performs LHS and Monte Carlo sampling for uncertainty quantification.

• class NonDLHSSingleInterval  
  Class for pure interval propagation using LHS.

• class NonDLocalEvidence  
  Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.

• class NonDLocalInterval  
  calculate interval bounds for epistemic uncertainty quantification

• class NonDLocalReliability  
  Class for the reliability methods within DAKOTA/UQ.

• class NonDLocalSingleInterval  
  calculate interval bounds for epistemic uncertainty quantification

• class NonDPolynomialChaos  
  quantification

• class NonDQuadrature  
  normals/uniforms/exponentials/betas/gammas.

• class NonDQUESOBayesCalibration  
  Bayesian inference using the QUESO library from UT Austin.

• class NonDReliability  
  Base class for the reliability methods within DAKOTA/UQ.

• class NonDSampling  
  NonDIncremLHSSampling, and NonDAdaptImpSampling.

• class NonDSparseGrid
integrals over independent standard random variables.

- **class NonDStochCollocation**
  - quantification

- **class NPSOLOptimizer**
  - Wrapper class for the NPSOL optimization library.

- **class ParallelLevel**
  - communicator partitioning.

- **class ParallelConfiguration**
  - collectively identify a particular multilevel parallel configuration.

- **class ParallelLibrary**
  - message passing within these levels.

- **class ParamResponsePair**
  - evaluation id.

- **class ParamStudy**
  - Class for vector, list, centered, and multidimensional parameter studies.

- **class PecosApproximation**
  - Derived approximation class for global basis polynomials.

- **class ProblemDescDB**
  - The database containing information parsed from the DAKOTA input file.

- **struct partial_prp_hash**
  - wrapper to delegate to the `ParamResponsePair` hash_value function

- **struct partial_prp_equality**
  - predicate for comparing ONLY the idInterface and Vars attributes of PRPair

- **class PSUADEDesignCompExp**
  - Wrapper class for the PSUADE library.

- **class RecastModel**
  - in order to recast the form of its inputs and/or outputs.

- **class RichExtrapVerification**
  - Class for Richardson extrapolation for code and solution verification.

- **class SensAnalysisGlobal**
  - and variance-based decomposition
• class \texttt{SequentialHybridStrategy}
  models of varying fidelity.

• class \texttt{SharedVariablesDataRep}
  or body, may be shared by multiple \texttt{SharedVariablesData} handle instances.

• class \texttt{SharedVariablesData}
  among a set of \texttt{Variables} instances.

• class \texttt{SingleMethodStrategy}
  single model.

• class \texttt{SingleModel}
  variables into responses.

• class \texttt{SNLLBase}
  \textit{Base class for OPT++ optimization and least squares methods.}

• class \texttt{SNLLLeastSq}
  \textit{Wrapper class for the OPT++ optimization library.}

• class \texttt{SNLLOptimizer}
  \textit{Wrapper class for the OPT++ optimization library.}

• class \texttt{SOLBase}
  \textit{Base class for Stanford SOL software.}

• class \texttt{SurfpackApproximation}
  \textit{Interface between Surfpack and Dakota.}

• class \texttt{SurrBasedGlobalMinimizer}
  \textit{and updates a global surrogate model without trust region controls}

• class \texttt{SurrBasedLocalMinimizer}
  \textit{and nonlinear least squares.}

• class \texttt{SurrBasedMinimizer}
  \textit{Base class for local/global surrogate-based optimization/least squares.}

• class \texttt{SurrogateModel}
  \textit{Base class for surrogate models (DataFitSurrModel and HierarchSurrModel).}

• class \texttt{SysCallAnalysisCode}
  \textit{simulations using system calls.}
• class SysCallApplicInterface
  using system calls.

• class TANA3Approximation
  approximation (a multipoint approximation).

• class TaylorApproximation
  series (a local approximation).

• class TrackerHTTP
  curl library

**Typedefs**

• typedef void(*) p_vf (void)

    MULTIDIM }
- enum { ESTIMATE_ORDER = 1, CONVERGE_ORDER, CONVERGE_QOI }
- enum EvalType { NLFEvaluator, CONEvaluator }

  enumeration for the type of evaluator function

- enum {
    TH_SILENT_OUTPUT, THQUIET_OUTPUT, TH_NORMAL_OUTPUT, TH_VERBOSE_OUTPUT,
    TH_DEBUG_OUTPUT }

Functions

- static const char *basename (const char *)

  return name of s, stripped of any leading path information

- static void cleanup_and_abort (const std::string &resname)

  output error message about results file and call abort

- int cast_from_realvector_to_vector (const Any &src, Any &dest)

  Cast from DAKOTA RealVector to std::vector<double>.

- int cast_from_vector_to_realvector (const Any &src, Any &dest)

  Cast from std::vector<double> to DAKOTA RealVector.
7.1 Dakota Namespace Reference

- int cast_from_intvector_to_vector (const Any &src, Any &dest)
  
  Cast from DAKOTA IntVector to std::vector<int>.

- int cast_from_vector_to_intvector (const Any &src, Any &dest)
  
  Cast from std::vector<int> to DAKOTA IntVector.

- int cast_from_int_to_unsignedint (const Any &src, Any &dest)
  
  Cast from int to unsigned int.

- int cast_from_unsignedint_to_int (const Any &src, Any &dest)
  
  Cast for unsigned in to int.

- int cast_from_charconst_to_string (const Any &src, Any &dest)
  
  Cast from char const* to std::string.

- bool register_dakota_cast()
  
  Register the cast functions.

- CommandShell & flush (CommandShell &shell)
  
  Convenient shell manipulator function to "flush" the shell

- bool operator== (const ActiveSet &set1, const ActiveSet &set2)
  
  Equality operator

- std::istream & operator>>(std::istream &s, ActiveSet &set)
  
  std::istream extraction operator for ActiveSet. Calls read(std::istream&).

- std::ostream & operator<<(std::ostream &s, const ActiveSet &set)
  
  std::ostream insertion operator for ActiveSet. Calls write(std::ostream&).

- BiStream & operator>>(BiStream &s, ActiveSet &set)
  
  BiStream extraction operator for ActiveSet. Calls read(BiStream&).

- BoStream & operator<<(BoStream &s, const ActiveSet &set)
  
  BoStream insertion operator for ActiveSet. Calls write(BoStream&).

- MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, ActiveSet &set)
  
  Calls read(MPIUnpackBuffer&).

- MPIPackBuffer & operator<<(MPIPackBuffer &s, const ActiveSet &set)
  
  MPIPackBuffer insertion operator for ActiveSet. Calls write(MPIPackBuffer&).

- bool operator!=(const ActiveSet &set1, const ActiveSet &set2)
  
  Inequality operator

- template<class ArrayT> void array_read (ArrayT &v, BiStream &s)
Read an array from BiStream, s.

- template<class ArrayT> void array_write (const ArrayT &v, BoStream &s)
  
  Write an array to BoStream, s.

- template<class ArrayT> BiStream & operator>> (BiStream &s, ArrayT &data)
  
  global BiStream extraction operator for generic "array" container

- template<class ArrayT> BoStream & operator<< (BoStream &s, const ArrayT &data)
  
  global BoStream insertion operator for generic "array" container

- std::istream & operator>>(std::istream &s, Constraints &con)
  
  std::istream extraction operator for Constraints

- std::ostream & operator<<(std::ostream &s, const Constraints &con)
  
  std::ostream insertion operator for Constraints

- bool interface_id_compare (const Interface &interface, const void *id)
  
  global comparison function for Interface

- NIDR_KWlib * nidr_lib_record (void *, const char *)
- void * nidr_dlopen (SharedLib *L, int k)
- static p_vf Lib_load (SharedLib *L, int k)

- static NLSSOLLeastSq * no_NLSSOL1 (NoDBBaseConstructor, Model &model)
- bool method_id_compare (const Iterator &iterator, const void *id)
  global comparison function for Iterator
- bool model_id_compare (const Model &model, const void *id)
  global comparison function for Model
- bool operator==(const ResponseRep &rep1, const ResponseRep &rep2)
  equality operator
- bool responses_id_compare (const Response &resp, const void *id)
  global comparison function for Response
- std::istream & operator>>(std::istream &s, Response &response)
  std::istream extraction operator for Response. Calls read(std::istream&).
- std::ostream & operator<<(std::ostream &s, const Response &response)
  std::ostream insertion operator for Response. Calls write(std::ostream&).
- BiStream & operator>>(BiStream &s, Response &response)
  BiStream extraction operator for Response. Calls read(BiStream&).
- BoStream & operator<<(BoStream &s, const Response &response)
  BoStream insertion operator for Response. Calls write(BoStream&).
- MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, Response &response)
  read(MPIUnpackBuffer&).
- MPIPackBuffer & operator<<(MPIPackBuffer &s, const Response &response)
  MPIPackBuffer insertion operator for Response. Calls write(MPIPackBuffer&).
- bool operator==(const Response &resp1, const Response &resp2)
equality operator

- bool operator!= (const Response &resp1, const Response &resp2)

inequality operator

- MPIPackBuffer & operator<< (MPIPackBuffer &s, const String &data)
  Reads String from buffer.

- MPIUnpackBuffer & operator>> (MPIUnpackBuffer &s, String &data)
  Writes String to buffer.

operator+ (const String &s1, const String &s2)
  Concatenate two Strings and return the resulting String.

operator+ (const String &s1, const char *s2)
  Append a String to a char* and return the resulting String.

operator+ (const String &s1, const char *s2)
  Append a char* to a String and return the resulting String.

operator+ (const std::string &s1, const String &s2)
  Append a String to a std::string and return the resulting String.

operator+ (const String &s1, const std::string &s2)
  Append a std::string to a String and return the resulting String.

toupper (const String &str)
  Returns a String converted to upper case. Calls String::toupper().

tolower (const String &str)
  Returns a String converted to lower case. Calls String::tolower().

bool operator==(const Variables &vars1, const Variables &vars2)
  equality operator

bool binary_equal_to (const Variables &vars1, const Variables &vars2)
  binary_equal_to (since 'operator==' is not suitable for boost/hash_set)

std::size_t hash_value (const Variables &vars)
  hash_value

bool variables_id_compare (const Variables &vars, const void *id)
  global comparison function for Variables

std::istream & operator>> (std::istream &s, Variables &vars)
  std::istream extraction operator for Variables.
- `std::ostream & operator<<(std::ostream &s, const Variables &vars)`
  `std::ostream insertion operator for Variables`.

- `BiStream & operator>>(BiStream &s, Variables &vars)`
  `BiStream extraction operator for Variables`.

- `BoStream & operator<<(BoStream &s, const Variables &vars)`
  `BoStream insertion operator for Variables`.

- `MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, Variables &vars)`
  `MPIUnpackBuffer extraction operator for Variables`.

- `MPIPackBuffer & operator<<(MPIPackBuffer &s, const Variables &vars)`
  `MPIPackBuffer insertion operator for Variables`.

- `bool operator!=(const Variables &vars1, const Variables &vars2)`
  `inequality operator`.

- `template<class T> std::ostream & operator<<(std::ostream &s, const std::set<T> &data)`
  `global std::ostream insertion operator for std::set`.

- `template<class T> MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, std::set<T> &data)`
  `global MPIUnpackBuffer extraction operator for std::set`.

- `template<class T> MPIPackBuffer & operator<<(MPIPackBuffer &s, const std::set<T> &data)`
  `global MPIPackBuffer insertion operator for std::set`.

- `template<typename OrdinalType, typename ScalarType> MPIPackBuffer & operator<<(MPIPackBuffer &s, const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &data)`
  `global MPIPackBuffer insertion operator for Teuchos::SerialDenseVector`.

- `template<typename OrdinalType, typename ScalarType> MPIPackBuffer & operator<<(MPIPackBuffer &s, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &data)`
  `global MPIPackBuffer insertion operator for Teuchos::SerialDenseMatrix`.

- `template<typename OrdinalType, typename ScalarType> MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &data)`
  `global MPIUnpackBuffer extraction operator for Teuchos::SerialDenseVector`.

- `template<typename OrdinalType, typename ScalarType> MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &data)`
  `global MPIUnpackBuffer extraction operator for Teuchos::SerialDenseMatrix`.
global MPIUnpackBuffer extraction operator for Teuchos::SerialDenseMatrix

- template<typenameOrdinalType, typename ScalarType> MPIUnpackBuffer &operator>>(MPIUnpackBuffer &s, Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &data)
  
  global MPIUnpackBuffer extraction operator for Teuchos::SerialSymDenseMatrix

- template<typenameOrdinalType, typename ScalarType> void read_data (std::istream &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v)
  
  standard istream extraction operator for full SerialDenseVector

- template<typenameOrdinalType, typename ScalarType> void read_data (std::istream &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArray &label_array)
  
  standard istream extraction operator for full SerialDenseVector with labels

- template<typenameOrdinalType, typename ScalarType> void read_data (std::istream &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArrayView label_array)
  
  standard istream extraction operator for full SerialDenseVector with labels

- template<typenameOrdinalType, typename ScalarType> void read_data_partial (std::istream &s, size_t start_index, size_t num_items, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v)
  
  standard istream extraction operator for partial SerialDenseVector

- template<typenameOrdinalType, typename ScalarType> void read_data_partial (std::istream &s, size_t start_index, size_t num_items, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArray &label_array)

  with labels

- template<typenameOrdinalType, typename ScalarType> void read_data_partial (std::istream &s, size_t start_index, size_t num_items, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArrayView label_array)

  with labels

- template<typenameOrdinalType, typename ScalarType> void read_data_tabular (std::istream &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v)
  
  tabular istream extraction operator for full SerialDenseVector

- template<typenameOrdinalType, typename ScalarType> void read_data_partial_tabular (std::istream &s, size_t start_index, size_t num_items, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v)
  
  tabular istream extraction operator for partial SerialDenseVector

- template<typenameOrdinalType, typename ScalarType> void read_data_annotated (std::istream &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArray &label_array)

  annotated istream extraction operator for full SerialDenseVector with labels

- template<typenameOrdinalType, typename ScalarType> void read_data_annotated (std::istream &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArrayView label_array)
annotated istream extraction operator for full SerialDenseVector with labels

- template<typename OrdinalType, typename ScalarType> void write_data (std::ostream &s, const ScalarType *v, OrdinalType len)
  standard ostream insertion operator for full SerialDenseVector

- template<typename OrdinalType, typename ScalarType> void write_data (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)
  standard ostream insertion operator for full SerialDenseVector

- template<typename OrdinalType, typename ScalarType> void write_data (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, const StringMultiArray &label_array)
  standard ostream insertion operator for full SerialDenseVector with labels

- template<typename OrdinalType, typename ScalarType> void write_data (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, StringMultiArrayConstView &label_array)

- template<typename OrdinalType, typename ScalarType> void write_data_aprepro (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, const StringMultiArray &label_array)
  aprepro ostream insertion operator for full SerialDenseVector with labels

- template<typename OrdinalType, typename ScalarType> void write_data_partial (std::ostream &s, size_t start_index, size_t num_items, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)
  standard ostream insertion operator for partial SerialDenseVector

- template<typename OrdinalType, typename ScalarType> void write_data_partial (std::ostream &s, size_t start_index, size_t num_items, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, const StringMultiArray &label_array)
  with labels

- template<typename OrdinalType, typename ScalarType> void write_data_partial_aprepro (std::ostream &s, size_t start_index, size_t num_items, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, const StringMultiArray &label_array)
  aprepro ostream insertion operator for partial SerialDenseVector with labels

- template<typename OrdinalType, typename ScalarType> void write_data_annotated (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, const StringMultiArray &label_array)
  annotated ostream insertion operator for full SerialDenseVector with labels

- template<typename OrdinalType, typename ScalarType> void write_data_tabular (std::ostream &s, const Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)
tabular ostream insertion operator for full SerialDenseVector

- template<typename OrdinalType, typename ScalarType> void write_data_partial_tabular (std::ostream &s, size_t start_index, size_t num_items, const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v)

  tabular ostream insertion operator for partial SerialDenseVector

- void write_data_tabular (std::ostream &s, StringMultiArrayConstView ma)

  tabular ostream insertion operator for view of StringMultiArray

- template<typename OrdinalType, typename ScalarType> std::istream & operator>>(std::istream &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &data)

  global std::istream extraction operator for SerialDenseVector

- template<typename OrdinalType, typename ScalarType> std::ostream & operator<<(std::ostream &s, const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &data)

  global std::ostream insertion operator for SerialDenseVector

- template<typename OrdinalType, typename ScalarType> void read_data (BiStream &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArray &label_array)

  SerialDenseVector with labels.

  template<typename OrdinalType, typename ScalarType> void read_data (BiStream &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArrayView label_array)

  SerialDenseVector with labels.

- template<typename OrdinalType, typename ScalarType> void write_data (MPIUnpackBuffer &s, const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArray &label_array)

  with labels

- template<typename OrdinalType, typename ScalarType> void read_data (MPIUnpackBuffer &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArrayView label_array)

  with labels

- template<typename OrdinalType, typename ScalarType> void write_data (MPIPackBuffer &s, const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArray &label_array)

  with labels

- template<typename OrdinalType, typename ScalarType> void read_data (std::istream &s, std::vector<Teuchos::SerialDenseVector<OrdinalType, ScalarType>> &va)

  standard istream extraction operator for std::vector of SerialDenseVectors
• template<typename OrdinalType, typename ScalarType> void read_data (std::istream &s, Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &m)
  standard istream extraction operator for SerialSymDenseMatrix

• template<typename OrdinalType, typename ScalarType> void read_data (BiStream &s, Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &m)
  standard binary stream extraction operator for SerialSymDenseMatrix

• template<typename OrdinalType, typename ScalarType> void read_data (MPIUnpackBuffer &s, Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &m)
  standard MPI buffer extraction operator for SerialSymDenseMatrix

• template<typename OrdinalType, typename ScalarType> void read_data (std::ostream &s, const Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &m, bool brackets, bool row_rtn, bool final_rtn)
  formatted ostream insertion operator for SerialSymDenseMatrix

• template<typename OrdinalType, typename ScalarType> void read_data (BoStream &s, const Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &m)
  standard binary stream insertion operator for SerialSymDenseMatrix

• template<typename OrdinalType, typename ScalarType> void read_data (MPIPackBuffer &s, const Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &m)
  standard MPI buffer insertion operator for SerialSymDenseMatrix

• template<typename OrdinalType, typename ScalarType> void read_data (std::ostream &s, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &m, bool brackets, bool row_rtn, bool final_rtn)
  formatted ostream insertion operator for SerialSymDenseMatrix

• template<typename OrdinalType, typename ScalarType> void write_col_vector_trans (std::ostream &s, OrdinalType col, OrdinalType num_items, bool brackets, bool break_line, bool final_rtn, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm)
  standard MPI buffer insertion operator for SerialSymDenseMatrix

• template<typename OrdinalType, typename ScalarType> void write_col_vector_trans (std::ostream &s, OrdinalType col, OrdinalType num_items, bool brackets, bool break_line, bool final_rtn, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm)
  ostream insertion operator for a column vector from a SerialDenseMatrix

• template<typename OrdinalType, typename ScalarType> void write_col_vector_trans (std::ostream &s, OrdinalType col, OrdinalType num_items, bool brackets, bool break_line, bool final_rtn, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm)
  ostream insertion operator for a column vector from a SerialDenseMatrix
**Ostream insertion operator for a column vector from a SerialDenseMatrix**

- template<typename IStreamType, typename OrdinalType, typename ScalarType> void read_col_vector_trans(IStreamType &s, OrdinalType col, Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm)

**Istream extraction operator for a column vector from a SerialDenseMatrix**

- template<class ArrayT> void array_read(ArrayT &v, std::istream &s)
  
  *read array from std::istream*

- template<class ArrayT> void array_write(const ArrayT &v, std::ostream &s)
  
  *write array to std::ostream*

- template<class ListT> void list_write(const ListT &l, std::ostream &s)
  
  *write list to std::ostream*

- template<class T> std::istream & operator>>(std::istream &s, std::vector<T> &data)
  
  *global std::istream extraction operator for std::vector*

- template<class T> std::ostream & operator<<(std::ostream &s, const std::vector<T> &data)
  
  *global std::ostream insertion operator for std::vector*

- template<class T> std::ostream & operator<<(std::ostream &s, const std::list<T> &data)
  
  *global std::ostream insertion operator for std::list*

- template<class ArrayT> void array_write(std::ostream &s, const ArrayT &v, const std::vector<String> &label_array)
  
  *write array to std::ostream with labels*

- template<class ArrayT> void array_write_aprepro(std::ostream &s, const ArrayT &v, const std::vector<String> &label_array)
  
  *write array to std::ostream (APREPRO format)*

- template<class ArrayT> void array_write_annotated(const ArrayT &v, std::ostream &s, bool write_len)
  
  *write_len = true*

- bool operator==(const ShortArray &dsa1, const ShortArray &dsa2)
  
  *equality operator for ShortArray*

- bool operator==(const StringArray &dsa1, const StringArray &dsa2)
  
  *equality operator for StringArray*

- bool operator==(const SizetArray &sa, SizetMultiArrayConstView smav)
  
  *equality operator for SizetArray and SizetMultiArrayConstView*

- void copy_data(const RealSymMatrix &rsdm, NEWMAT::SymmetricMatrix &sm)
  
  *copy data from RealSymMatrix to NEWMAT::SymmetricMatrix*
copy RealSymMatrix to NEWMAT::SymmetricMatrix

- void copy_data (const RealMatrix &rdm, NEWMAT::Matrix &m)
  copy RealMatrix to NEWMAT::Matrix

- void copy_data (const NEWMAT::ColumnVector &cv, RealVector &rdv)
  copy NEWMAT::ColumnVector to RealVector

- void copy_data (const Real *rdv, const int num_items, NEWMAT::ColumnVector &cv)
  copy Real* (column of Teuchos_SerialDenseMatrix) to NEWMAT::ColumnVector

- void copy_data (const RealVector &rdv, NEWMAT::ColumnVector &cv)
  copy RealVector to NEWMAT::ColumnVector

- void copy_data (const DDaceSamplePoint &dsp, RealVector &rdv)
  copy DDACE point to RealVector

- void copy_data (const std::vector<DDaceSamplePoint> &dspa, RealVectorArray &rdva)
  copy DDACE point array to RealVectorArray

- void copy_data (const std::vector<DDaceSamplePoint> &dspa, Real *ptr, const int ptr_len)
  copy DDACE point array to Real*

- bool operator== (const IntArray &dia1, const IntArray &dia2)
  equality operator for IntArray

- bool operator!= (const IntArray &dia1, const IntArray &dia2)
  inequality operator for IntArray

- bool operator!= (const ShortArray &dsa1, const ShortArray &dsa2)
  inequality operator for ShortArray

- bool operator!= (const StringArray &dsa1, const StringArray &dsa2)
  inequality operator for StringArray

- bool operator!= (const SizetArray &sa, SizetMultiArrayConstView smav)
  inequality operator for StringArray

- void build_label (String &label, const String &root_label, size_t tag)
  create a label by appending a numerical tag to the root_label

- void build_labels (StringArray &label_array, const String &root_label)
  label_array. Uses build_label().

- void build_labels (StringMultiArray &label_array, const String &root_label)
  label_array. Uses build_label().
• **void build_labels_partial** (StringArray &label_array, const String &root_label, size_t start_index, size_t num_items)
  
  of entries in label_array. Uses `build_label()`.

• **void copy_row_vector** (const RealMatrix &m, RealMatrix::ordinalType i, std::vector<Real> &row)
  
  Copies a row of a Teuchos_SerialDenseMatrix<int, Real> to std::vector<Real>.

• **template<class T> void copy_data** (const std::vector<T> &dbv, T *ptr, const int ptr_len)
  
  copy Array<T> to T*

• **template<typename OrdinalType, typename ScalarType> void copy_data** (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdva, ScalarType *ptr, const OrdinalType ptr_len, const String &ptr_type)
  
  copy Teuchos::SerialDenseVector<OT,ST> to ST*

• **template<typename OrdinalType, typename ScalarType> void copy_data** (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv, Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm, OrdinalType nr, OrdinalType nc)
  
  copy Teuchos::SerialDenseVector<OT,ST> to Teuchos::SerialDenseMatrix<OT,ST>

• **template<class T> void copy_data** (const std::list<T> &dl, std::vector<T> &da)
  
  copy std::list<T> to std::vector<T>

• **template<class T> void copy_data** (const std::list<T> &dl, std::vector<std::vector<T>> &d2a, size_t num_a, size_t a_len)
  
  copy std::list<T> to std::vector<std::vector<T>> (unroll vecOfvecs into vector)

• **template<class T> void copy_data** (const std::map<int, T> &im, std::vector<T> &da)
  
  copy map<int, T> to std::vector<T> (discard integer keys)

• **template<typename OrdinalType, typename ScalarType> void copy_data** (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv1, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv2)
  
  (used in place of operator= when a deep copy of a vector view is needed)

• **template<typename OrdinalType, typename ScalarType> void copy_data** (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv, std::vector<ScalarType> &da)
  
  std::vector<ScalarType>

• **template<typename OrdinalType, typename ScalarType> void copy_data** (const std::vector< ScalarType > &da, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv)
  
  Teuchos::SerialDenseVector<OrdinalType, ScalarType>.
• template<typename OrdinalType, typename ScalarType> void copy_data (const ScalarType *ptr, const OrdinalType ptr_len, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv)
  
  copy ScalarType* to Teuchos::SerialDenseVector<OrdinalType, ScalarType>

• template<typename OrdinalType, typename ScalarType> void copy_data (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv, ScalarType *ptr, const OrdinalType ptr_len)
  
  copy ScalarType* to Teuchos::SerialDenseVector<OrdinalType, ScalarType>

• template<typename OrdinalType, typename ScalarType> void copy_data (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv, std::vector<Teuchos::SerialDenseVector<OrdinalType, ScalarType>> &sdva, OrdinalType num_vec, OrdinalType vec_len)
  
  copy SerialDenseVector<> to Array<SerialDenseVector<>>

• template<typename OrdinalType, typename ScalarType> void copy_data_partial (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv1, OrdinalType start_index1, OrdinalType num_items, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv2)
  
  copy portion of first SerialDenseVector to all of second SerialDenseVector

• template<typename OrdinalType, typename ScalarType> void copy_data_partial (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv1, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv2, OrdinalType start_index2)
  
  copy all of first SerialDenseVector to portion of second SerialDenseVector

• template<typename OrdinalType, typename ScalarType> void copy_data_partial (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv1, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv2, OrdinalType start_index1, OrdinalType num_items, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv3, OrdinalType start_index3)
  
  copy SerialDenseVector;

• template<class T> void copy_data_partial (const std::vector<T> &da1, size_t start_index1, size_t num_items, std::vector<T> &da2)
  
  copy portion of first Array<T> to all of second Array<T>

• template<class T> void copy_data_partial (const std::vector<T> &da1, std::vector<T> &da2, size_t start_index2)
  
  copy all of first Array<T> to portion of second Array<T>

• template<class T> void copy_data_partial (const std::vector<T> &da1, boost::multi_array<T, 1> &bma, size_t start_index_bma)
  
  copy all of first Array<T> to portion of boost::multi_array<T, 1>

• template<class T> void copy_data_partial (const std::vector<T> &da1, size_t start_index1, size_t num_items, std::vector<T> &da2, size_t start_index2)
  
  copy portion of first Array<T> to portion of second Array<T>

• void merge_data_partial (const IntVector &d_array, RealVector &m_array, size_t start_index_ma)
  
  aggregate continuous and discrete arrays into a single merged array
- template<typename OrdinalType, typename ScalarType> const ScalarType & set_index_to_value (OrdinalType index, const std::set<ScalarType> &values)
  retrieve the set value corresponding to the passed index

- template<typename ScalarType> size_t set_value_to_index (const ScalarType &value, const std::set<ScalarType> &values)
  calculate the set index corresponding to the passed value

- template<typename OrdinalType, typename ScalarType> void x_y_pairs_to_x_set (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &xy_pairs, std::set<ScalarType> &x_set)
  std::set of (x), discarding the y values

- template<typename MultiArrayType, typename DataType> size_t find_index (const MultiArrayType &a, const DataType &search_data)

- template<typename MultiArrayType, typename DakArrayType> void copy_data (const MultiArrayType &ma, DakArrayType &da)

- template<class T> size_t find_index (const boost::multi_array<T, 1> &bma, const T &search_data)
  compute the index of an entry within a boost::multi_array

- size_t find_index (SizetMultiArrayConstView bmacv, size_t search_data)
  compute the index of an entry within a boost::multi_array view

- size_t find_index (StringMultiArrayConstView bmacv, const String &search_data)
  compute the index of an entry within a boost::multi_array view

- template<class ListT> ListT::size_type find_index (const ListT &l, const typename ListT::value_type &val)
  compute the index of an entry within a std::list

- void copy_data (SizetMultiArrayConstView ma, SizetArray &da)
  copy boost::multi_array view to Array

- void copy_data (StringMultiArrayConstView ma, StringArray &da)
  copy boost::multi_array view to Array

- template<typename DakContainerType> bool contains (const DakContainerType &v, const typename DakContainerType::value_type &val)
  return true if the item val appears in container v

- template<class ListT> ListT::size_type count_if (const ListT &l, bool(*test_fn)(const typename ListT::value_type &, const std::string &), const std::string &test_fn_data)
  test_fn w.r.t. the passed test_fn_data

- template<class ListT> ListT::const_iterator find_if (const ListT &l, bool(*test_fn)(const typename ListT::value_type &, const std::string &), const std::string &test_fn_data)
  predicate test_fn w.r.t. the passed test_fn_data; end if not found
• MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataInterface &data)
  MPIPackBuffer insertion operator for DataInterface.

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, DataInterface &data)
  MPIUnpackBuffer extraction operator for DataInterface.

• std::ostream & operator<<(std::ostream &, const DataInterface &data)
  std::ostream insertion operator for DataInterface

• MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataMethod &data)
  MPIPackBuffer insertion operator for DataMethod.

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, DataMethod &data)
  MPIUnpackBuffer extraction operator for DataMethod.

• std::ostream & operator<<(std::ostream &, const DataMethod &data)
  std::ostream insertion operator for DataMethod

• MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataModel &data)
  MPIPackBuffer insertion operator for DataModel.

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, DataModel &data)
  MPIUnpackBuffer extraction operator for DataModel.

• std::ostream & operator<<(std::ostream &, const DataModel &data)
  std::ostream insertion operator for DataModel

• MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataResponses &data)
  MPIPackBuffer insertion operator for DataResponses.

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, DataResponses &data)
  MPIUnpackBuffer extraction operator for DataResponses.

• std::ostream & operator<<(std::ostream &, const DataResponses &data)
  std::ostream insertion operator for DataResponses

• MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataStrategy &data)
  MPIPackBuffer insertion operator for DataStrategy.

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, DataStrategy &data)
  MPIUnpackBuffer extraction operator for DataStrategy.

• std::ostream & operator<<(std::ostream &, const DataStrategy &data)
  std::ostream insertion operator for DataStrategy

• MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataVariables &data)
**MPIPackBuffer** insertion operator for *DataVariables*.

- **MPIUnpackBuffer & operator>>()** (MPIUnpackBuffer &s, DataVariables &data)
  **MPIUnpackBuffer** extraction operator for *DataVariables*.

- std::ostream & operator<< (std::ostream &s, const DataVariables &data)
  std::ostream insertion operator for *DataVariables*

- **int salinas_main**(int argc, char *argv[], MPI_Comm *comm)
  subroutine interface to SALINAS simulation code

- **int dlsolver_option**(Opt_Info *o)
- **void abort_handler**(int code)
  global function which handles serial or parallel aborts

- **RealVector const *continuous_lower_bounds**(Optimizer1 *o)

• int perform_analysis (char *iteration_num)

• template<typename T> string asstring (const T &val)
  
  Creates a string from the argument val using an ostringstream.

• void run_dakota_data ()
  
  mode 2: direct Data class instantiation.

• void run_dakota_data ()
  
  mode 2: direct Data class instantiation.

• PACKBUF (int, MPI_INT)

• UNPACKBUF (int, MPI_INT)

• PACKSIZE (int, MPI_INT)

• MPIPackBuffer & operator<< (MPIPackBuffer &buff, const int &data)
  
  insert an int

• MPIPackBuffer & operator<< (MPIPackBuffer &buff, const u_int &data)
  
  insert a u_int

• MPIPackBuffer & operator<< (MPIPackBuffer &buff, const long &data)
  
  insert a long

• MPIPackBuffer & operator<< (MPIPackBuffer &buff, const u_long &data)
  
  insert a u_long

• MPIPackBuffer & operator<< (MPIPackBuffer &buff, const short &data)
  
  insert a short

• MPIPackBuffer & operator<< (MPIPackBuffer &buff, const u_short &data)
  
  insert a u_short

• MPIPackBuffer & operator<< (MPIPackBuffer &buff, const char &data)
  
  insert a char

• MPIPackBuffer & operator<< (MPIPackBuffer &buff, const u_char &data)
  
  insert a u_char

• MPIPackBuffer & operator<< (MPIPackBuffer &buff, const double &data)
  
  insert a double

• MPIPackBuffer & operator<< (MPIPackBuffer &buff, const float &data)
  
  insert a float

• MPIPackBuffer & operator<< (MPIPackBuffer &buff, const bool &data)
  
  insert a bool
• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &buff, int &data)
  extract an int

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &buff, u_int &data)
  extract a u_int

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &buff, long &data)
  extract a long

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &buff, u_long &data)
  extract a u_long

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &buff, short &data)
  extract a short

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &buff, u_short &data)
  extract a u_short

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &buff, char &data)
  extract a char

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &buff, u_char &data)
  extract a u_char

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &buff, double &data)
  extract a double

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &buff, float &data)
  extract a float

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &buff, bool &data)
  extract a bool

• template<class ContainerT> void container_read (ContainerT &c, MPIUnpackBuffer &s)
  Read a generic container (vector<T>, list<T>) from MPIUnpackBuffer, s.

• template<class ContainerT> void container_write (const ContainerT &c, MPIPackBuffer &s)
  Write a generic container to MPIPackBuffer, s.

• template<class ContainerT> MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, ContainerT &data)
  global MPIUnpackBuffer extraction operator for generic container

• template<class ContainerT> MPIPackBuffer & operator<<(MPIPackBuffer &s, const ContainerT &data)
  global MPIPackBuffer insertion operator for generic container
• int MPIPackSize (const int &data, const int num=1)
  
  return packed size of an int

• int MPIPackSize (const u_int &data, const int num=1)
  
  return packed size of a u_int

• int MPIPackSize (const long &data, const int num=1)
  
  return packed size of a long

• int MPIPackSize (const u_long &data, const int num=1)
  
  return packed size of a u_long

• int MPIPackSize (const short &data, const int num=1)
  
  return packed size of a short

• int MPIPackSize (const u_short &data, const int num=1)
  
  return packed size of a u_short

• int MPIPackSize (const char &data, const int num=1)
  
  return packed size of a char

• int MPIPackSize (const u_char &data, const int num=1)
  
  return packed size of a u_char

• int MPIPackSize (const double &data, const int num=1)
  
  return packed size of a double

• int MPIPackSize (const float &data, const int num=1)
  
  return packed size of a float

• int MPIPackSize (const bool &data, const int num=1)
  
  return packed size of a bool

• Real rel_change_c_star (const RealVector &curr_c_star, const RealVector &prev_c_star)

  Computes relative change between successive c_stars using Euclidean norm.

• std::istream & operator>>(std::istream &, ParamResponsePair &pair)

  std::istream extraction operator for ParamResponsePair

• std::ostream & operator<<(std::ostream &, const ParamResponsePair &pair)

  std::ostream insertion operator for ParamResponsePair

• BiStream & operator>>(BiStream &, ParamResponsePair &pair)

  BiStream extraction operator for ParamResponsePair.

• BoStream & operator<<(BoStream &, const ParamResponsePair &pair)

  BoStream insertion operator for ParamResponsePair.

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &, ParamResponsePair &pair)

  MPIUnpackBuffer extraction operator for ParamResponsePair.
• MPIPackBuffer & operator<< (MPIPackBuffer &s, const ParamResponsePair &pair)
  
  MPIPackBuffer insertion operator for ParamResponsePair.

• bool operator==(const ParamResponsePair &pair1, const ParamResponsePair &pair2)
  
  equality operator

• bool operator!=(const ParamResponsePair &pair1, const ParamResponsePair &pair2)
  
  inequality operator

• static void * binsearch (void *kw, size_t ksize, size_t n, const char *key)

  on ActiveSet content (request vector and derivative variables vector)

• bool id_vars_exact_compare (const ParamResponsePair &database_pr, const ParamResponsePair &search_pr)
  
  search function for a particular ParamResponsePair within a PRPMultiIndex

• std::size_t hash_value (const ParamResponsePair &prp)
  
  hash_value for ParamResponsePairs stored in a PRPMultiIndex

• PRPCacheHIter hashedCacheBegin (PRPCache &prp_cache)
  
  hashed definition of cache begin

• PRPCacheHIter hashedCacheEnd (PRPCache &prp_cache)
  
  hashed definition of cache end

• PRPQueueHIter hashedQueueBegin (PRPQueue &prp_queue)
  
  hashed definition of queue begin

• PRPQueueHIter hashedQueueEnd (PRPQueue &prp_queue)
  
  hashed definition of queue end

• PRPCacheHIter lookup_by_val (PRPMultiIndexCache &prp_cache, const ParamResponsePair &search_pr)
  
  ActiveSet search data within search_pr.

• bool lookup_by_val (PRPMultiIndexCache &prp_cache, const ParamResponsePair &search_pr, ParamResponsePair &found_pr)
  
  lookup_by_val(PRPMultiIndexCache&, ParamResponsePair&)
- **PRPCacheHIter lookup_by_val** (PRPMultiIndexCache &prp_cache, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set)
  
  *based on interface id, variables, and ActiveSet search data*

- **bool lookup_by_val** (PRPMultiIndexCache &prp_cache, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, ParamResponsePair &found_pr)
  
  *variables, and ActiveSet search data*

- **bool lookup_by_val** (PRPMultiIndexCache &prp_cache, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, int &found_eval_id)
  
  *based on interface id, variables, and ActiveSet search data*

- **bool lookup_by_val** (PRPMultiIndexCache &prp_cache, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, Response &found_resp)
  
  *based on interface id, variables, and ActiveSet search data*

- **PRPCacheOIter lookup_by_ids** (PRPMultiIndexCache &prp_cache, const IntStringPair &search_ids)
  
  *(i.e. std::pair<eval_id,interface_id>) search data*

- **bool lookup_by_ids** (PRPMultiIndexCache &prp_cache, const IntStringPair &search_eval_interface_ids, ParamResponsePair &found_pr)
  
  *eval_interface_ids*

- **bool lookup_by_ids** (PRPMultiIndexCache &prp_cache, const ParamResponsePair &search_pr, ParamResponsePair &found_pr)
  
  *eval_interface_ids from the ParamResponsePair search data*

- **PRPQueueHIter lookup_by_val** (PRPMultiIndexQueue &prp_queue, const ParamResponsePair &search_pr)
  
  *ActiveSet search data within search_pr.*

- **bool lookup_by_val** (PRPMultiIndexQueue &prp_queue, const ParamResponsePair &search_pr, ParamResponsePair &found_pr)
  
  *lookup_by_val(PRPMultiIndexQueue&, ParamResponsePair&)*

- **PRPQueueHIter lookup_by_val** (PRPMultiIndexQueue &prp_queue, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set)
  
  *based on interface id, variables, and ActiveSet search data*

- **bool lookup_by_val** (PRPMultiIndexQueue &prp_queue, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, ParamResponsePair &found_pr)
  
  *variables, and ActiveSet search data*

- **bool lookup_by_val** (PRPMultiIndexQueue &prp_queue, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, int &found_eval_id)
  
  *based on interface id, variables, and ActiveSet search data*
• bool lookup_by_val (PRPMultiIndexQueue& prp_queue, const String &search_interface_id, const Variables &search_vars, const ActiveSet &search_set, Response &found_resp)
  based on interface id, variables, and ActiveSet search data

• PRPQueueOIter lookup_by_eval_id (PRPMultiIndexQueue &prp_queue, const int &search_id)
  (i.e. integer eval_id) search data

• bool lookup_by_eval_id (PRPMultiIndexQueue& prp_queue, const int &search_id, ParamResponsePair &found_pr)
  find a ParamResponsePair within a PRPMultiIndexQueue based on eval_id

• bool lookup_by_eval_id (PRPMultiIndexQueue& prp_queue, const ParamResponsePair &search_pr, ParamResponsePair &found_pr)
  eval_id from the ParamResponsePair search data

• void print_restart (int argc, char **argv, String print_dest)
  print a restart file

• void print_restart_tabular (int argc, char **argv, String print_dest)
  print a restart file (tabular format)

• void read_neutral (int argc, char **argv)
  read a restart file (neutral file format)

• void repair_restart (int argc, char **argv, String identifier_type)
  repair a restart file by removing corrupted evaluations

• void concatenate_restart (int argc, char **argv)
  concatenate multiple restart files

Variables

• const volatile bool dakota_cast_registered = register_dakota_cast()
• ParallelLibrary * Dak_pl
  set by ParallelLibrary, for use in CLH

• ProblemDescDB dummy_db
  dummy ProblemDescDB object used for mandatory reference initialization when a real ProblemDescDB instance is unavailable

• ParallelLibrary dummy_lib
  dummy ParallelLibrary object used for mandatory reference initialization when a real ParallelLibrary instance is unavailable
• ProblemDescDB dummy_db
  dummy ProblemDescDB object used for mandatory reference initialization when a real ProblemDescDB instance is unavailable
• Graphics dakota_graphics
  the global Dakota::Graphics object used by strategies, models, and approximations
• Interface dummy_interface
  dummy Interface object used for mandatory reference initialization or default virtual function return by reference when a real Interface instance is unavailable
• Model dummy_model
  dummy Model object used for mandatory reference initialization or default virtual function return by reference when a real Model instance is unavailable
• Iterator dummy_iterator
  dummy Iterator object used for mandatory reference initialization or default virtual function return by reference when a real Iterator instance is unavailable
• ProblemDescDB dummy_db
  dummy ProblemDescDB object used for mandatory reference initialization when a real ProblemDescDB instance is unavailable
7.1 Dakota Namespace Reference

- **ParallelLibrary dummy_lib**
  - dummy `ParallelLibrary` object used for mandatory reference initialization when a real `ParallelLibrary` instance is unavailable

- **const char ∗ FIELD_NAMES []**
- **const int NUMBER_OF_FIELDS = 25**
- **PRPCache data_pairs**
  - contains all parameter/response pairs.

- **Dakota_funcs ∗ DF**
- **Dakota_funcs DakFuncs0**
- **static time_t start_time**
- **static char ∗ progsname**
- **static int dakdrive**
- **static char simap [256]**
- **static char ∗ wd_path [N_wdpath]**
- **std::ostream ∗ dakota_cout = &cout**
  - DAKOTA stdout initially points to cout, but may be redirected to a tagged ofstream if there are concurrent iterators.

- **std::ostream ∗ dakota_cerr = &cerr**
  - DAKOTA stderr initially points to cerr, but may be redirected to a tagged ofstream if there are concurrent iterators.

- **PRPCache data_pairs**
  - contains all parameter/response pairs.

- **BoStream write_restart**
  - the restart binary output stream (doesn’t really need to be global anymore except for abort_handler()).

- **Graphics dakota_graphics**
  - the global Dakota::Graphics object used by strategies, models, and approximations

- **int write_precision = 10**
  - used in ostream data output functions (restart_util.C overrides this default value)

- **ParallelLibrary dummy_lib ("dummy")**
  - dummy `ParallelLibrary` object used for mandatory reference initialization when a real `ParallelLibrary` instance is unavailable

- **ProblemDescDB dummy_db**
  - dummy `ProblemDescDB` object used for mandatory reference initialization when a real `ProblemDescDB` instance is unavailable

- **int mc_ptr_int = 0**
  - global pointer for ModelCenter API

- **int dc_ptr_int = 0**
global pointer for ModelCenter eval DB

- **ProblemDescDB** * Dak_pddb
  set by ProblemDescDB, for use in parsing

- **ParallelLibrary** * Dak_pl
  set by ParallelLibrary, for use in CLH

- **const size_t _NPOS = ~(size_t)0**
  special value returned by index() when entry not found

- **std::ostream * dakota_cout**
  DAKOTA stdout initially points to cout, but may be redirected to a tagged ofstream if there are concurrent iterators.

- **std::ostream * dakota_cerr**
  DAKOTA stderr initially points to cerr, but may be redirected to a tagged ofstream if there are concurrent iterators.

- **int write_precision**
  used in ostream data output functions (*restart_util.C* overrides this default value)

- **int mc_ptr_int**
  global pointer for ModelCenter API

- **int dc_ptr_int**
  global pointer for ModelCenter eval DB

  set by ParallelLibrary, for use in CLH
• ParallelLibrary dummy_lib
  dummy ParallelLibrary object used for mandatory reference initialization when a real ParallelLibrary instance is unavailable
7.1.1 Detailed Description

The primary namespace for DAKOTA.

The COLINOptimizer class wraps COLIN, a Sandia-developed C++ optimization interface library. A variety of COLIN optimizers are defined in COLIN and its associated libraries, including SCOLIB which contains the optimization components from the old COLINY (formerly SGOPT) library. COLIN contains optimizers such as genetic algorithms, pattern search methods, and other nongradient-based techniques. COLINOptimizer uses a COLINApplication object to perform the function evaluations.

The user input mappings are as follows: max_iterations, max_function_evaluations, convergence_tolerance, and solution_accuracy are mapped into COLIN's max_iterations, max_function_evaluations_this_trial, function_value_tolerance, sufficient_objective_value properties. An outputLevel is mapped to COLIN's output_level property and a setting of debug activates output of method initialization and sets the COLIN debug attribute to 10000 for the DEBUG output level. Refer to [Hart, W.E., 2006] for additional information on COLIN objects and controls.

7.1.2 Function Documentation

7.1.2.1 CommandShell & flush (CommandShell & shell)

convenient shell manipulator function to "flush" the shell
global convenience function for manipulating the shell; invokes the class member flush function.

7.1.2.2 void start_dakota_heartbeat (int)

Heartbeat function provided by not_executable.C; pass output interval in seconds, or -1 to use SDAKOTA_HEARTBEAT

7.1.2.3 Real Dakota::getdist (const RealVector & x1, const RealVector & x2)

Gets the Euclidean distance between x1 and x2

7.1.2.4 Real Dakota::mindist (const RealVector & x, const RealMatrix & xset, int except)

Returns the minimum distance between the point x and the points in the set xset (compares against all points in xset except point "except"): if except is not needed, pass 0.
7.1 Dakota Namespace Reference

7.1.2.5 Real Dakota::mindistindx (const RealVector & x, const RealMatrix & xset, const IntArray & indx)

Gets the min distance between x and points in the set xset defined by the nindx values in indx.

7.1.2.6 Real Dakota::getRmax (const RealMatrix & xset)

Gets the maximum of the min distance between each point and the rest of the set.

7.1.2.7 T Dakota::abort_handler_t (int code)

Templatized abort_handler_t method that allows for convenient return from methods that otherwise have no sensible return from error clauses. Usage: MyType& method() { return abort_handler<MyType&>(-1); }

7.1.2.8 int Dakota::start_grid_computing (char * analysis_driver_script, char * params_file, char * results_file)

Sample function prototype for launching grid computing

7.1.2.9 int Dakota::stop_grid_computing ()

Sample function prototype for terminating grid computing

7.1.2.10 int Dakota::perform_analysis (char * iteration_num)

Sample function prototype for submitting a grid evaluation

7.1.2.11 string Dakota::asstring (const T & val)

Creates a string from the argument val using an ostringstream.
This only gets used in this file and is only ever called with ints so no error checking is in place.

Parameters:
val The value of type T to convert to a string.

Returns:
The string representation of val created using an ostringstream.

7.1.2.12 void Dakota::run_dakota_data ()

Mode 2: direct Data class instantiation.
Rather than parsing from an input file, this function populates Data class objects directly using a minimal specification and relies on constructor defaults and post-processing in post_process() to fill in the rest.
7.1.2.13  

void Dakota::run_dakota_data ()

mode 2: direct Data class instantiation.

Rather than parsing from an input file, this function populates Data class objects directly using a minimal specification and relies on constructor defaults and post-processing in post_process() to fill in the rest.

7.1.2.14  

bool Dakota::set_compare (const ParamResponsePair & database_pr, const ActiveSet & search_set)  [inline]

on ActiveSet content (request vector and derivative variables vector)
a global function to compare the ActiveSet of a particular database_pr (presumed to be in the global history list) with a passed in ActiveSet (search_set).

7.1.2.15  

bool Dakota::id_vars_exact_compare (const ParamResponsePair & database_pr, const ParamResponsePair & search_pr)  [inline]

search function for a particular ParamResponsePair within a PRPMultiIndex
a global function to compare the interface id and variables of a particular database_pr (presumed to be in the global history list) with a passed in key of interface id and variables provided by search_pr.

7.1.2.16  

PRPCacheHIter Dakota::lookup_by_val (PRPMultiIndexCache & prp_cache, const ParamResponsePair & search_pr)  [inline]

ActiveSet search data within search_pr.

Lookup occurs in two steps: (1) PRPMultiIndexCache lookup based on strict equality in interface id and variables, and (2) set_compare() post-processing based on ActiveSet subset logic.

7.1.2.17  

PRPQueueHIter Dakota::lookup_by_val (PRPMultiIndexQueue & prp_queue, const ParamResponsePair & search_pr)  [inline]

ActiveSet search data within search_pr.

Lookup occurs in two steps: (1) PRPMultiIndexQueue lookup based on strict equality in interface id and variables, and (2) set_compare() post-processing based on ActiveSet subset logic.

7.1.2.18  

void print_restart (int argc, char ** argv, String print_dest)

print a restart file

Usage:  "dakota_restart_util print dakota.rst"
"dakota_restart_util to_neutral dakota.rst dakota.neu"

Prints all evals. in full precision to either stdout or a neutral file. The former is useful for ensuring that duplicate detection is successful in a restarted run (e.g., starting a new method from the previous best), and the latter is used for translating binary files between platforms.
7.1 Dakota Namespace Reference

7.1.2.19  void print_restart_tabular (int argc, char ** argv, String print_dest)

print a restart file (tabular format)

Usage: "dakota_restart_util to_pdb dakota.rst dakota.pdb"
"dakota_restart_util to_tabular dakota.rst dakota.txt"

Unrolls all data associated with a particular tag for all evaluations and then writes this data in a tabular format (e.g., to a PDB database or MATLAB/TECPLOT data file).

7.1.2.20  void read_neutral (int argc, char ** argv)

read a restart file (neutral file format)

Usage: "dakota_restart_util from_neutral dakota.neu dakota.rst"

Reads evaluations from a neutral file. This is used for translating binary files between platforms.

7.1.2.21  void repair_restart (int argc, char ** argv, String identifier_type)

repair a restart file by removing corrupted evaluations

Usage: "dakota_restart_util remove 0.0 dakota_old.rst dakota_new.rst"
"dakota_restart_util remove_ids 2 7 13 dakota_old.rst dakota_new.rst"

Repairs a restart file by removing corrupted evaluations. The identifier for evaluation removal can be either a double precision number (all evaluations having a matching response function value are removed) or a list of integers (all evaluations with matching evaluation ids are removed).

7.1.2.22  void concatenate_restart (int argc, char ** argv)

concatenate multiple restart files

Usage: "dakota_restart_util cat dakota_1.rst ... dakota_n.rst dakota_new.rst"

Combines multiple restart files into a single restart database.

7.1.3 Variable Documentation

7.1.3.1 const char* FIELD_NAMES[]

Initial value:

{ "numFns", "numVars", "numACV", "numADIV", "numADRV", "numDerivVars", "xC", "xDI", "xDR", "xCLabels", "xDILabels", "xDRLabels", "directFnASV", "directFnASM", "directFnDVV", "directFnDVV_bool", "fnFlag", "gradFlag", "hessFlag", "fnVals", "fnGrads", "fnHessians", "fnLabels", "failure", "fnEvalId" }
fields to pass to Matlab in Dakota structure

7.1.3.2 const int NUMBER_OF_FIELDS = 25
	number of fields in above structure

7.1.3.3 Dakota_funcs DakFuncs0

Initial value:

7.2 SIM Namespace Reference

plug facilities into DAKOTA.

Classes

- class ParallelDirectApplicInterface
  \[ plug-ins using \textit{assign\_rep}(). \]

- class SerialDirectApplicInterface
  \[ plug-ins using \textit{assign\_rep}(). \]

7.2.1 Detailed Description

plug facilities into DAKOTA.

A typical use of plug-ins with assign\_rep() is to publish a simulation interface for use in library mode See Interfacing with DAKOTA as a Library for more information.
Chapter 8

DAKOTA Class Documentation

8.1 ActiveSet Class Reference

active set request vector and the derivative variables vector.

Public Member Functions

- **ActiveSet ()**
  
  *default constructor*

- **ActiveSet (size_t num_fns, size_t num_deriv_vars)**
  
  *standard constructor*

- **ActiveSet (const ActiveSet &set)**
  
  *copy constructor*

- **~ActiveSet ()**
  
  *destructor*

- **ActiveSet & operator= (const ActiveSet &set)**
  
  *assignment operator*

- **void reshape (size_t num_fns, size_t num_deriv_vars)**
  
  *reshape requestVector and derivVarsVector*

- **const ShortArray & request_vector () const**
  
  *return the request vector*

- **void request_vector (const ShortArray &rv)**
  
  *set the request vector*
• void request_values (const short rv_val)
  set all request vector values

• void request_value (const size_t index, const short rv_val)
  set the value of an entry in the request vector

• const SizetArray & derivative_vector () const
  return the derivative variables vector

• void derivative_vector (const SizetArray &dvv)
  set the derivative variables vector from a SizetArray

• void derivative_vector (SizetMultiArrayConstView dvv)
  set the derivative variables vector from a SizetMultiArrayConstView

• void derivative_start_value (size_t dvv_start_val)
  set the derivative variables vector values

• void read (std::istream &s)
  read an active set object from an std::istream

• void write (std::ostream &s) const
  write an active set object to an std::ostream

• void write.annotated (std::ostream &s) const
  write an active set object to an std::ostream in annotated format

• void read (BiStream &s)
  read an active set object from the binary restart stream

• void write (BoStream &s) const
  write an active set object to the binary restart stream

• void read (MPIUnpackBuffer &s)
  read an active set object from a packed MPI buffer

• void write (MPIPackBuffer &s) const
  write an active set object to a packed MPI buffer

Private Attributes

• ShortArray requestVector
  the vector of response requests

• SizetArray derivVarsVector
  the vector of variable ids used for computing derivatives
Friends

- bool operator==(const ActiveSet &set1, const ActiveSet &set2)
  
  equality operator

- bool operator!=(const ActiveSet &set1, const ActiveSet &set2)
  
  inequality operator

8.1.1 Detailed Description

The ActiveSet class is a small class whose initial design function is to avoid having to pass the ASV and DVV separately. It is not part of a class hierarchy and does not employ reference-counting/representation-sharing idioms (e.g., handle-body).

8.1.2 Member Data Documentation

8.1.2.1 ShortArray requestVector [private]

the vector of response requests

It uses a 0 value for inactive functions and sums 1 (value), 2 (gradient), and 4 (Hessian) for active functions.

8.1.2.2 SizetArray derivVarsVector [private]

the vector of variable ids used for computing derivatives

These ids will generally identify either the active continuous variables or the inactive continuous variables.

The documentation for this class was generated from the following files:

- DakotaActiveSet.H
- DakotaActiveSet.C
8.2 AnalysisCode Class Reference

processes for managing simulations.

Inheritance diagram for AnalysisCode::

Public Member Functions

- void `define_filenames` (const int id)
  
  *file and tagging options*

- void `write_parameters_files` (const Variables &vars, const ActiveSet &set, const Response &response, const int id)
  
  *write_parameters_file() in either standard or aprepro format*

- void `read_results_files` (Response &response, const int id)
  
  *read the response object from one or more results files*

- `const std::vector<String> & program_names () const`
  
  *return programNames*

- `const std::string & input_filter_name () const`
  
  *return iFilterName*

- `const std::string & output_filter_name () const`
  
  *return oFilterName*

- `const std::string & parameters_filename () const`
  
  *return paramsFileName*

- `const std::string & results_filename () const`
  
  *return resultsFileName*

- `const std::string & results_filename (const int id)`
  
  *return the results filename entry in fileNameMap corresponding to id*

- void `suppress_output_flag` (const bool flag)
  
  *set suppressOutputFlag*

- bool `suppress_output_flag () const`
8.2 AnalysisCode Class Reference

\[\text{return suppressOutputFlag}\]

- bool command_line_arguments () const
  \[\text{return commandLineArgs}\]

- bool multiple_parameters_filenames () const
  \[\text{return multipleParamsFiles}\]

- void file_cleanup () const
  \[\text{remove temporary files if not fileSaveFlag}\]

**Protected Member Functions**

- AnalysisCode (const ProblemDescDB &problem_db)
  \[\text{constructor}\]

- ~AnalysisCode ()
  \[\text{destructor}\]

- const char * work_dir () const
  \[\text{return Workdir if useWorkdir is true (only called by derived classes)}\]

**Protected Attributes**

- bool suppressOutputFlag
  \[\text{flag set by master processor to suppress output from slave processors}\]

- short outputLevel
  \[\text{output verbosity level: \{SILENT,QUIET,NORMAL,VERBOSE,DEBUG\} \_OUTPUT}\]

- bool fileTagFlag
  \[\text{flags tagging of parameter/results files}\]

- bool fileSaveFlag
  \[\text{flags retention of parameter/results files}\]

- bool commandLineArgs
  \[\text{the analysis drivers and input/output filters}\]

- bool apreproFlag
  \[\text{format for parameter files}\]

- bool multipleParamsFiles
analysis drivers

- std::string iFilterName
  the name of the input filter (input_filter user specification)

- std::string oFilterName
  the name of the output filter (output_filter user specification)

- std::vector<String> programNames
  specification

- size_t numPrograms
  the number of analysis code programs (length of programNames)

- std::string specifiedParamsFileName
  the name of the parameters file from user specification

- std::string paramsFileName
  temp files

- std::string specifiedResultsFileName
  the name of the results file from user specification

- std::string resultsFileName
  the results file name actually used (modified with tagging or temp files)

- bool allowExistingResults
  and only fork if needed

- std::string curWorkdir
  working directory when useWorkdir is true

- std::map<int, std::pair<std::string, std::string>> fileNameMap
  evaluations. Map key is the function evaluation identifier.

- bool useWorkdir
  whether to use a new or specified work_directory

- std::string workDir
  its name, if specified...

- bool dirTag
  whether to tag the working directory

- bool dirSave
  whether dir_save was specified
• bool dirDel
  whether to delete the directory when Dakota terminates

• std::string templateDir
  template directory (if specified)

• StringArray templateFiles
  template files (if specified)

• bool templateCopy
  whether to force a copy (versus link) every time

• bool templateReplace
  whether to replace existing files

• bool haveTemplateDir
  state variable for template directory

• bool haveWorkdir
  for dirTag, whether we have workDir

• std::string dakDir
  Dakota directory (if needed).

Private Member Functions

• void write_parameters_file(const Variables &vars, const ActiveSet &set, const Response &response, const std::string &prog, const std::vector<String> &an_comps, const std::string &params_fname)
  standard or aprepro format

Private Attributes

• ParallelLibrary & parallelLib
  reference to the ParallelLibrary object. Used in define_filenames().

• String2DArray analysisComponents
  (from the analysis_components interface specification)
8.2.1 Detailed Description

processes for managing simulations. The AnalysisCode class hierarchy provides simulation spawning services for ApplicationInterface derived classes and alleviates these classes of some of the specifics of simulation code management. The hierarchy does not employ the letter-envelope technique since the ApplicationInterface derived classes instantiate the appropriate derived AnalysisCode class directly.

The documentation for this class was generated from the following files:

- AnalysisCode.H
- AnalysisCode.C
8.3 Analyzer Class Reference

hierarchy.

Inheritance diagram for Analyzer::

```
Analyzer
  
Iterator
  
NonD
    NonDCalibration
    NonDExpansion
    NonDIntegration
    NonDInterval
    NonDReliability
    NonDSampling

PStudyDACE
  DDACEDesignCompExp
  RichExtrapVerification

Verification
  FSUDesignCompExp
  ParamStudy
  PSUADEDesignCompExp
```

Public Member Functions

- const VariablesArray & all_variables ()
  
  return the complete set of evaluated variables

- const RealMatrix & all_samples ()
  
  return the complete set of evaluated samples

- const ResponseArray & all_responses () const
  
  return the complete set of computed responses

Protected Member Functions

- Analyzer ()
  
  default constructor

- Analyzer (Model &model)
  
  standard constructor

- Analyzer (NoDBBaseConstructor, Model &model)
  
  alternate constructor for instantiations “on the fly” with a Model

- Analyzer (NoDBBaseConstructor)
alternate constructor for instantiations "on the fly" without a Model

- ~Analyzer ()
  destructor

- virtual void vary_pattern (bool pattern_flag)
  sets varyPattern in derived classes that support it

- virtual void get_parameter_sets (Model &model)
  Returns one block of samples (ndim * num_samples).

- virtual void update_model_from_sample (Model &model, const Real *sample_vars)
  update model’s current variables with data from sample

- virtual void update_model_from_variables (Model &model, const Variables &vars)
  update model’s current variables with data from vars

- void pre_output ()
  convenience function to write variables to file, following pre-run

- void print_results (std::ostream &s)
  print the final iterator results

- const Variables & variables_results () const
  return a single final iterator solution (variables)

- const Response & response_results () const
  return a single final iterator solution (response)

- const VariablesArray & variables_array_results ()
  only be used if returns_multiple_points() returns true.

- const ResponseArray & response_array_results ()
  only be used if returns_multiple_points() returns true.

- void response_results_active_set (const ActiveSet &set)
  set the requested data for the final iterator response results

- bool compact_mode () const
  returns Analyzer::compactMode

- bool returns_multiple_points () const
  return is false. Override to return true if appropriate.

- void evaluate_parameter_sets (Model &model, bool log_resp_flag, bool log_best_flag)
  into response sets (allResponses)
• void `variance_based_decomp` (int ncont, int ndiscint, int ndiscreal, int num_samples)
• void `read_variables_responses` (int num_evals, size_t num_vars)
    read num_evals variables/responses from file
• void `print_sobol_indices` (std::ostream &s) const
    Printing of VBD results.
• void `sample_to_variables` (const Real *sample_c_vars, Variables &vars)
    convert samples array to variables array; e.g., allSamples to allVariables
• void `samples_to_variables_array` (const RealMatrix &sample_matrix, VariablesArray &vars_array)
    convert samples array to variables array; e.g., allSamples to allVariables
• void `variables_array_to_samples` (const VariablesArray &vars_array, RealMatrix &sample_matrix)
    convert variables array to samples array; e.g., allVariables to allSamples

Protected Attributes

• bool `compactMode`
    switch for allSamples (compact mode) instead of allVariables (normal mode)
• VariablesArray `allVariables`
    array of all variables to be evaluated in `evaluate_parameter_sets()`
• RealMatrix `allSamples`
    compact alternative to allVariables
• ResponseArray `allResponses`
    array of all responses to be computed in `evaluate_parameter_sets()`
• StringArray `allHeaders`
    array of headers to insert into output while evaluating allVariables
• size_t `numObjFns`
    number of objective functions
• size_t `numLSqTerms`
    number of least squares terms
• RealPairPRPMultiMap `bestVarsRespMap`
    map which stores best set of solutions
Private Member Functions

- void compute_best_metrics (const Response &response, std::pair<Real, Real> &metrics)
  
  compares current evaluation to best evaluation and updates best

- void update_best (const Variables &vars, int eval_id, const Response &response)
  
  compares current evaluation to best evaluation and updates best

- void update_best (const Real *sample_c_vars, int eval_id, const Response &response)
  
  compares current evaluation to best evaluation and updates best

Private Attributes

- Real vbdDropTol
  
  tolerance for omitting output of small VBD indices

- RealVectorArray S4
  
  VBD main effect indices.

- RealVectorArray T4
  
  VBD total effect indices.

8.3.1 Detailed Description

hierarchy.

The Analyzer class provides common data and functionality for various types of systems analysis, including nondeterministic analysis, design of experiments, and parameter studies.

8.3.2 Member Function Documentation

8.3.2.1 void print_results (std::ostream & s) [protected, virtual]

print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().

Reimplemented from Iterator.

Reimplemented in PStudyDACE, Verification, NonDExpansion, NonDGlobalReliability, NonDGPMSABayesCalibration, NonDIncrementalLHSSampling, NonDInterval, NonDLHSSampling, NonDLocalReliability, and RichExtrapVerification.
8.3.2.2 void evaluate_parameter_sets (Model & model, bool log_resp_flag, bool log_best_flag)  
[protected]
into response sets (allResponses)
Convenience function for derived classes with sets of function evaluations to perform (e.g., NonDSampling, 
DDACEDesignCompExp, FSUDesignCompExp, ParamStudy).

8.3.2.3 void variance_based_decomp (int ncont, int ndiscint, int ndiscreal, int num_samples)  
[protected]
Calculation of sensitivity indices obtained by variance based decomposition. These indices are obtained by the 
Saltelli version of the Sobol VBD which uses (K+2)\*N function evaluations, where K is the number of dimensions 
(uncertain vars) and N is the number of samples.

8.3.2.4 void print_sobol_indices (std::ostream & s) const  [protected]
Printing of VBD results.
printing of variance based decomposition indices.
The documentation for this class was generated from the following files:

- DakotaAnalyzer.H
- DakotaAnalyzer.C
8.4 ApplicationInterface Class Reference

interfaces to simulation codes.

Inheritance diagram for ApplicationInterface::

```
  Interface
  ApplicationInterface
     DirectApplicInterface
     ForkApplicInterface
     GridApplicInterface
     SysCallApplicInterface
     ParallelDirectApplicInterface
     SerialDirectApplicInterface
```

Public Member Functions

- **ApplicationInterface** (const ProblemDescDB &problem_db)
  
  constructor

- **~ApplicationInterface** ()
  
  destructor

Protected Member Functions

- void **init_communicators** (const IntArray &message_lengths, const int &max_iterator_concurrency)
  
  iterator and concurrent multiprocessor analyses within an evaluation.

- void **set_communicators** (const IntArray &message_lengths)
  
  (the partitions are already allocated in ParallelLibrary).

- void **free_communicators** ()
  
  iterator and concurrent multiprocessor analyses within an evaluation.

- void **init_serial** ()

- int **asynch_local_evaluation_concurrency** () const
  
  return asynchLocalEvalConcurrency

- String **interface_synchronization** () const
  
  return interfaceSynchronization

- void **map** (const Variables &vars, const ActiveSet &set, Response &response, const bool asynch_flag=false)
  
  Protected due to Interface letter-envelope idiom.

- void **manage_failure** (const Variables &vars, const ActiveSet &set, Response &response, int failed_eval_id)
manages a simulation failure using abort/retry/recover/continuation

- const IntResponseMap & synch ()
  
  beforeSynchCorePRPQueue and returns all jobs

- const IntResponseMap & synch_nowait ()
  
  beforeSynchCorePRPQueue and returns a partial set of completed jobs

- void serve_evaluations ()
  
  run on evaluation servers to serve the iterator master

- void stop_evaluation_servers ()
  
  used by the iterator master to terminate evaluation servers

- virtual void derived_map (const Variables &vars, const ActiveSet &set, Response &response, int fn_eval_id)
  
  that is specific to a derived class.

- virtual void derived_map_asynch (const ParamResponsePair &pair)
  
  asynchronous evaluation that is specific to a derived class.

- virtual void derived_synch (PRPQueue &prp_queue)
  
  classes. This version waits for at least one completion.

- virtual void derived_synch_nowait (PRPQueue &prp_queue)
  
  any completions if none are immediately available.

- void self_schedule_analyses ()
  
  evaluation using message passing

- void serve_analyses_synch ()
  
  analysis job at a time

- virtual int derived_synchronous_local_analysis (const int &analysis_id)
  
  ApplicationInterface::serve_analyses_synch().

**Protected Attributes**

- ParallelLibrary & parallelLib

8.4.1 Detailed Description

interfaces to simulation codes.

ApplicationInterface provides an interface class for performing parameter to response mappings using simulation code(s). It provides common functionality for a number of derived classes and contains the majority of all of the scheduling algorithms in DAKOTA. The derived classes provide the specifics for managing code invocations using system calls, forks, direct procedure calls, or distributed resource facilities.

8.4.2 Member Function Documentation

8.4.2.1 void init_serial () [inline, protected, virtual]

DataInterface.C defaults of 0 servers are needed to distinguish an explicit user request for 1 server (serialization of a parallelism level) from no user request (use parallel auto-config). This default causes problems when init_communicators() is not called for an interface object (e.g., static scheduling fails in DirectApplicationInterface::derived_map() for NestedModel::optionalInterface). This is the reason for this function: to reset certain defaults for interface objects that are used serially.

Reimplemented from Interface.

8.4.2.2 void map (const Variables & vars, const ActiveSet & set, Response & response, const bool asynch_flag = false) [protected, virtual]

Protected due to Interface letter-envelope idiom.

The function evaluator for application interfaces. Called from derived_compute_response() and derived_asynch_compute_response() in derived Model classes. If asynch_flag is not set, perform a blocking evaluation (using derived_map()). If asynch_flag is set, add the job to the beforeSynchCorePRPQueue queue for execution by one of the scheduler routines in synch() or synch_nowait(). Duplicate function evaluations are detected with duplication_detect().

Reimplemented from Interface.

8.4.2.3 const IntResponseMap & synch () [protected, virtual]

beforeSynchCorePRPQueue and returns all jobs

This function provides blocking synchronization for all cases of asynchronous evaluations, including the local asynchronous case (background system call, nonblocking fork, & multithreads), the message passing case, and the hybrid case. Called from derived_synchronize() in derived Model classes.

Reimplemented from Interface.
8.4.2.4 const IntResponseMap & synch_nowait () [protected, virtual]

beforeSynchCorePRPQueue and returns a partial set of completed jobs

This function will eventually provide nonblocking synchronization for all cases of asynchronous evaluations, however it currently supports only the local asynchronous case since nonblocking message passing schedulers have not yet been implemented. Called from derived_synchronize_nowait() in derived Model classes.

Reimplemented from Interface.

8.4.2.5 void serve_evaluations () [protected, virtual]

run on evaluation servers to serve the iterator master

Invoked by the serve() function in derived Model classes. Passes control to serve_evaluations_asynch(), serve_evaluations_peer(), or serve_evaluations_synch() according to specified concurrency and self/static scheduler configuration.

Reimplemented from Interface.

8.4.2.6 void stop_evaluation_servers () [protected, virtual]

used by the iterator master to terminate evaluation servers

This code is executed on the iteratorComm rank 0 processor when iteration on a particular model is complete. It sends a termination signal (tag = 0 instead of a valid fn_eval_id) to each of the slave analysis servers. NOTE: This function is called from the Strategy layer even when in serial mode. Therefore, use iteratorCommSize to provide appropriate fall through behavior.

Reimplemented from Interface.

8.4.2.7 void self_schedule_analyses () [protected]

evaluation using message passing

This code is called from derived classes to provide the master portion of a master-slave algorithm for the dynamic self-scheduling of analyses among slave servers. It is patterned after self_schedule_evaluations(). It performs no analyses locally and matches either serve_analyses_synch() or serve_analyses_asynch() on the slave servers, depending on the value of asynchLocalAnalysisConcurrency. Self-scheduling approach assigns jobs in 2 passes. The 1st pass gives each server the same number of jobs (equal to asynchLocalAnalysisConcurrency). The 2nd pass assigns the remaining jobs to slave servers as previous jobs are completed. Single- and multilevel parallel use intra- and inter-communicators, respectively, for send/receive. Specific syntax is encapsulated within Parallel-Library.

8.4.2.8 void serve_analyses_synch () [protected]

analysis job at a time

This code is called from derived classes to run synchronous analyses on slave processors. The slaves receive requests (blocking receive), do local derived_map_ac’s, and return codes. This is done continuously until a termination signal is received from the master. It is patterned after serve_evaluations_synch().
8.4.2.9  bool duplication_detect (const Variables & vars, Response & response, const bool asynch_flag)
[private]

evaluation request has already been performed or queued
Called from map() to check incoming evaluation request for duplication with content of data_pairs and before-SynchCorePRPQueue. If duplication is detected, return true, else return false. Manage bookkeeping with history-DuplicateMap and beforeSynchDuplicateMap. Note that the list searches can get very expensive if a long list is searched on every new function evaluation (either from a large number of previous jobs, a large number of pending jobs, or both). For this reason, a user request for deactivation of the evaluation cache results in a complete bypass of duplication_detect(), even though a beforeSynchCorePRPQueue search would still be meaningful. Since the intent of this request is to streamline operations, both list searches are bypassed.

8.4.2.10  void self_schedule_evaluations ()  [private]

using message passing; executes on iteratorComm master
This code is called from synch() to provide the master portion of a master-slave algorithm for the dynamic self-scheduling of evaluations among slave servers. It performs no evaluations locally and matches either serve_evaluations_synch() or serve_evaluations_asynch() on the slave servers, depending on the value of asynchLocalEvalConcurrency. Self-scheduling approach assigns jobs in 2 passes. The 1st pass gives each server the same number of jobs (equal to asynchLocalEvalConcurrency). The 2nd pass assigns the remaining jobs to slave servers as previous jobs are completed. Single- and multilevel parallel use intra- and inter-communicators, respectively, for send/receive. Specific syntax is encapsulated within ParallelLibrary.

8.4.2.11  void static_schedule_evaluations ()  [private]

using message passing; executes on iteratorComm master
This code runs on the iteratorCommRank 0 processor (the iterator) and is called from synch() in order to assign a static schedule. It matches serve_evaluations_peer() for any other processors within the 1st evaluation partition and serve_evaluations_synch()/serve_evaluations_asynch() for all other evaluation partitions (depending on asynchLocalEvalConcurrency). It performs function evaluations locally for its portion of the static schedule using either asynchronous_local_evaluations() or synchronous_local_evaluations(). Single-level and multilevel parallel use intra- and inter-communicators, respectively, for send/receive. Specific syntax is encapsulated within ParallelLibrary. The iteratorCommRank 0 processor assigns the static schedule since it is the only processor with access to beforeSynchCorePRPQueue (it runs the iterator and calls synchronize). The alternate design of each peer selecting its own jobs using the modulus operator would be applicable if execution of this function (and therefore the job list) were distributed.

8.4.2.12  void asynchronous_local_evaluations (PRPQueue & prp_queue)  [private]

the local processor
This function provides blocking synchronization for the local asynch case (background system call, nonblocking fork, or threads). It can be called from synch() for a complete local scheduling of all asynchronous jobs or from static_schedule_evaluations() to perform a local portion of the total job set. It uses the derived_map_asynch() to initiate asynchronous evaluations and derived_synch() to capture completed jobs, and mirrors the self_schedule_evaluations() message passing scheduler as much as possible (derived_synch() is modeled after MPI_Waitsome()).
8.4.2.13  void asynchronous_local_evaluations_static (PRPQueue & prp_queue)  [private]

asynchLocalEvalConcurrency

Locally statically-scheduled counterpart to asynchronous_local_evaluations. This scheduling policy specifically
ensures that a completed asynchronous evaluation eval_id is replaced with an equivalent one, modulo asynch-
LocalEvalConcurrency. Designed to help with parallel tiling. A disadvantage of this scheduling policy is that is
could leave local asynchronous worker “servers” idle in parsing the prp_queue, e.g., when restarting and some
evals are already complete. In fact, anytime this function is called with non-contiguous eval_id’s the full possible
concurrency won’t be leveraged.

This is currently only supported when DAKOTA is running in serial. Supporting in the MPI static / asynch local
hybrid mode would require MPI static schedule that is either fully round-robin or fully block scheduled, not the
present hybrid. It is not clear how to support this in the MPI self scheduled / asynch local hybrid mode.

If local evaluation concurrency is unlimited, this function is not needed.

8.4.2.14  void synchronous_local_evaluations (PRPQueue & prp_queue)  [private]

the local processor

This function provides blocking synchronization for the local synchronous case (foreground system call, blocking
fork, or procedure call from derived_map()). It is called from static_schedule_evaluations() to perform a local
portion of the total job set.

8.4.2.15  void asynchronous_local_evaluations_nowait (PRPQueue & prp_queue)  [private]

static-scheduling cases)

This function provides nonblocking synchronization for the local asynch case (background system call, non-
blocking fork, or threads). It is called from synch_nowait() and passed the complete set of all asynchronous jobs
(beforeSynchCorePRPQueue). It uses derived_map_asynch() to initiate asynchronous evaluations and derived_-
synch_nowait() to capture completed jobs in nonblocking mode. It mirrors a nonblocking message passing sched-
uler as much as possible (derived_synch_nowait() modeled after MPI_Testsome()). The result of this function is
rawResponseMap, which uses eval_id as a key. It is assumed that the incoming prp_queue contains only active
and new jobs - i.e., all completed jobs are cleared by synch_nowait().

Also supports asynchronous local evaluations with static scheduling. This scheduling policy specifically ensures
that a completed asynchronous evaluation eval_id is replaced with an equivalent one, modulo asynchLocalEval-
Concurrency. In the nowait case, this could render some servers idle if evaluations don’t come in eval_id order or
some evaluations are cancelled by the caller in between calls. If this function is called with unlimited local eval
concurrency, the static scheduling request is ignored.

8.4.2.16  void serve_evaluations_synch ()  [private]

one synchronous evaluation at a time

This code is invoked by serve_evaluations() to perform one synchronous job at a time on each slave/peer server.
The servers receive requests (blocking receive), do local synchronous maps, and return results. This is done continuously until a termination signal is received from the master (sent via `stop_evaluation_servers()`).

### 8.4.2.17 `void serve_evaluations_asynch()` [private]

multiple asynchronous evaluations

This code is invoked by `serve_evaluations()` to perform multiple asynchronous jobs on each slave/peer server. The servers test for any incoming jobs, launch any new jobs, process any completed jobs, and return any results. Each of these components is nonblocking, although the server loop continues until a termination signal is received from the master (sent via `stop_evaluation_servers()`). In the master-slave case, the master maintains the correct number of jobs on each slave. In the static scheduling case, each server is responsible for limiting concurrency (since the entire static schedule is sent to the peers at start up).

### 8.4.2.18 `void serve_evaluations_peer()` [private]

one synchronous evaluation at a time as part of the 1st peer

This code is invoked by `serve_evaluations()` to perform a synchronous evaluation in coordination with the iterator-CommRank 0 processor (the iterator) for static schedules. The `bcast()` matches either the `bcast()` in `synchronous_local_evaluations()`, which is invoked by `static_schedule_evaluations()`, or the `bcast()` in `map()`.

  approximation lower bounds (used by 3D graphics and Surfpack KrigingModel)

- **RealVector approxUpperBounds**

  approximation upper bounds (used by 3D graphics and Surfpack KrigingModel)

**Private Member Functions**

- **Approximation * get_approx** (ProblemDescDB &problem_db, size_t num_vars)

  approxRep to the appropriate derived type.

- **Approximation * get_approx** (const String &approx_type, const UShortArray &approx_order, size_t num_vars, unsigned short data_order)

  approxRep to the appropriate derived type.

- **void add** (const Variables &vars, const Response &response, int fn_index, bool anchor_flag)

  extract the relevant RealVector from Variables and invoke add(RealVector&)

- **void add** (const Real *sample_c_vars, const Response &response, int fn_index, bool anchor_flag)

  create a RealVector view and invoke add(RealVector&)

- **void add** (const RealVector &sample_c_vars, const Response &response, int fn_index, bool anchor_flag)

  dictated by anchor_flag. Uses add_point() and add_anchor().

- **void add_point** (const RealVector &x, const Real &fn_val, const RealVector &fn_grad, const RealSymMatrix &fn_hess)

  add a new data point by appending to currentPoints

- **void add_anchor** (const RealVector &x, const Real &fn_val, const RealVector &fn_grad, const RealSymMatrix &fn_hess)

  add a new data point by assigning to anchorPoint
### Private Attributes

- **SDP2DArray savedSDPSets**
  
  that is later restored (in `restore()` and `finalize()`)

- **size_t popCount**
  
  number of points previously added by `append()` to be removed by `pop()`

- **Approximation * approxRep**
  
  pointer to the letter (initialized only for the envelope)

- **int referenceCount**
  
  number of objects sharing approxRep

### 8.5.1 Detailed Description

Base class for the approximation class hierarchy.

The `Approximation` class is the base class for the response data fit approximation class hierarchy in DAKOTA. One instance of an `Approximation` must be created for each function to be approximated (a vector of Approximations is contained in `ApproximationInterface`). For memory efficiency and enhanced polymorphism, the approximation hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (`Approximation`) serves as the envelope and one of the derived classes (selected in `Approximation::get_approx()`) serves as the letter.

### 8.5.2 Constructor & Destructor Documentation

#### 8.5.2.1 `Approximation()`

default constructor

The default constructor is used in `Array<Approximation>` instantiations and by the alternate envelope constructor. `approxRep` is NULL in this case (`problem_db` is needed to build a meaningful `Approximation` object). This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

#### 8.5.2.2 `Approximation(ProblemDescDB & problem_db, size_t num_vars)`

standard constructor for envelope

Envelope constructor only needs to extract enough data to properly execute `get_approx`, since `Approximation(BaseConstructor, problem_db)` builds the actual base class data for the derived approximations.

#### 8.5.2.3 `Approximation(const String & approx_type, const UShortArray & approx_order, size_t num_vars, unsigned short data_order)`

alternate constructor
This is the alternate envelope constructor for instantiations on the fly. Since it does not have access to problem_db, the letter class is not fully populated. This constructor executes get_approx(type), which invokes the default constructor of the derived letter class, which in turn invokes the default constructor of the base class.

### 8.5.2.4 Approximation (const Approximation & approx)

*copy constructor*

Copy constructor manages sharing of approxRep and incrementing of referenceCount.

### 8.5.2.5 ~Approximation () [virtual]

*destructor*

Destructor decrements referenceCount and only deletes approxRep when referenceCount reaches zero.

### 8.5.2.6 Approximation (BaseConstructor, const ProblemDescDB & problem_db, size_t num_vars) [protected]

*derived class constructors - Coplien, p. 139)*

This constructor is the one which must build the base class data for all derived classes. get_approx() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid recursion in the base class constructor calling get_approx() again). Since the letter IS the representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in ~Approximation).

### 8.5.3 Member Function Documentation

#### 8.5.3.1 Approximation operator= (const Approximation & approx)

*assignment operator*

#### 8.5.3.2 void clear_current () [inline, virtual]

*clear current build data in preparation for next build*

Redefined by TANA3Approximation to clear current data but preserve history.

Reimplemented in TANA3Approximation.

#### 8.5.3.3 void clear_all () [inline]

*clear all build data (current and history) to restore original state*

Clears out any history (e.g., TANA3Approximation use for a different response function in NonDReliability).
8.5.3.4 **Approximation** * get_approx (ProblemDescDB & problem_db, size_t num_vars)  [private]

approxRep to the appropriate derived type.
Used only by the envelope constructor to initialize approxRep to the appropriate derived type.

8.5.3.5 **Approximation** * get_approx (const String & approx_type, const UShortArray & approx_order, size_t num_vars, unsigned short data_order)  [private]

approxRep to the appropriate derived type.
Used only by the envelope constructor to initialize approxRep to the appropriate derived type.

8.5.4 **Member Data Documentation**

8.5.4.1 **unsigned short dataOrder**  [protected]

request vector 3-bit format.
This setting should not be inferred from the responses specification, since we may need gradient support for evaluating gradients at a single point (e.g., the center of a trust region), but not require gradient evaluations at every point.

  but asynchronous virtual functions are supported through bookkeeping).

8.6.1 Detailed Description

approximations to simulation-based results.
ApproximationInterface provides an interface class for building a set of global/local/multipoint approximations and performing approximate function evaluations using them. It contains a list of Approximation objects, one for each response function.

8.6.2 Member Function Documentation

8.6.2.1 void update_approximation (const Variables & vars, const Response & response) [protected, virtual]

This function populates/replaces each Approximation::anchorPoint with the incoming variables/response data point.
Reimplemented from Interface.
8.6.2.2 void update_approximation (const RealMatrix & samples, const ResponseArray & resp_array) [protected, virtual]

This function populates/replaces each Approximation::currentPoints with the incoming variables/response arrays. Reimplemented from Interface.

8.6.2.3 void update_approximation (const VariablesArray & vars_array, const ResponseArray & resp_array) [protected, virtual]

This function populates/replaces each Approximation::currentPoints with the incoming variables/response arrays. Reimplemented from Interface.

8.6.2.4 void append_approximation (const Variables & vars, const Response & response) [protected, virtual]

This function appends to each Approximation::currentPoints with one incoming variables/response data point. Reimplemented from Interface.

8.6.2.5 void append_approximation (const RealMatrix & samples, const ResponseArray & resp_array) [protected, virtual]

This function appends to each Approximation::currentPoints with multiple incoming variables/response data points. Reimplemented from Interface.

8.6.2.6 void append_approximation (const VariablesArray & vars_array, const ResponseArray & resp_array) [protected, virtual]

This function appends to each Approximation::currentPoints with multiple incoming variables/response data points. Reimplemented from Interface.

8.6.2.7 void build_approximation (const BoolDeque & rebuild_deque, const RealVector & lower_bnds, const RealVector & upper_bnds) [protected, virtual]

This function finds the coefficients for each Approximation based on the data passed through update_approximation() calls. The bounds are used only for graphics visualization. Reimplemented from Interface.

8.6.2.8 void rebuild_approximation (const BoolDeque & rebuild_deque) [protected, virtual]

This function updates the coefficients for each Approximation based on data increments provided by {update,append}_approximation().
Reimplemented from Interface.

8.6.2.9 void pop_approximation (bool save_sdp_set) [protected, virtual]
This function removes data provided by a previous call to append_approximation().
Reimplemented from Interface.

8.6.2.10 void restore_approximation () [protected, virtual]
This function updates the coefficients for each Approximation based on data increments provided by {update,append}_approximation().
Reimplemented from Interface.

8.6.2.11 bool restore_available () [protected, virtual]
This function updates the coefficients for each Approximation based on data increments provided by {update,append}_approximation().
Reimplemented from Interface.

8.6.3 Member Data Documentation

8.6.3.1 std::vector<Approximation> functionSurfaces [private]
list of approximations, one per response function
This formulation allows the use of mixed approximations (i.e., different approximations used for different response functions), although the input specification is not currently general enough to support it.
The documentation for this class was generated from the following files:

- ApproximationInterface.H
- ApproximationInterface.C
8.7 APPSEvalMgr Class Reference

Evaluation manager class for APPSPACK.

Public Member Functions

- **APPSEvalMgr (Model &model)**
  
  Evaluation manager class for APPSPACK.

- **~APPSEvalMgr ()**
  
  destructor

- **bool isReadyForWork () const**
  
  tells APPS whether or not there is a processor available to perform a function evaluation

- **bool submit (const int apps_tag, const HOPSPACK::Vector &apps_xtrial, HOPSPACK::EvalRequestType apps_request)**
  
  performs a function evaluation at APPS-provided x_in

- **int recv (int &apps_tag, HOPSPACK::Vector &apps_f, HOPSPACK::Vector &apps_cEqs, HOPSPACK::Vector &apps_cIneqs, string &apps_msg)**
  
  returns a function value to APPS

- **void printDebugInfo (void) const**
  
  empty implementation of debug info needed to complete the interface

- **void printTimingInfo (void) const**
  
  empty implementation of timing info needed to complete the interface

- **void set_asynch_flag (const bool dakotaAsynchFlag)**
  
  publishes whether or not to do asynchronous evaluations

- **void set_blocking_synch (const bool blockingSynchFlag)**
  
  publishes whether or not APPS is operating synchronously

- **void set_total_workers (const int numDakotaWorkers)**
  
  publishes the number of processors available for function evaluations

- **void set_constraint_map (std::vector<int> constraintMapIndices, std::vector<double> constraintMapMultipliers, std::vector<double> constraintMapOffsets)**
  
  publishes constraint transformation
Private Attributes

- **Model & iteratedModel**
  reference to the APPSOptimizer's model passed in the constructor

- **bool modelAsyncFlag**
  flag for asynchronous function evaluations

- **bool blockingSynch**
  flag for APPS synchronous behavior

- **int numWorkersUsed**
  number of processors actively performing function evaluations

- **int numWorkersTotal**
  total number of processors available for performing function evaluations

- **std::vector < int > constrMapIndices**
  map from Dakota constraint number to APPS constraint number

- **std::vector < double > constrMapMultipliers**
  multipliers for constraint transformations

- **std::vector < double > constrMapOffsets**
  offsets for constraint transformations

- **RealVector xTrial**
  trial iterate

- **std::map < int, int > tagList**
  map of DAKOTA eval id to APPS eval id (for asynchronous evaluations)

- **std::map < int, RealVector > functionList**
  map of APPS eval id to responses (for synchronous evaluations)

- **IntResponseMap dakotaResponseMap**
  map of DAKOTA responses returned by synchronize_nowait()

### 8.7.1 Detailed Description

Evaluation manager class for APPSPACK.

The APPSEvalMgr class is derived from APPSPACK’s Executor class. It implements the methods of that class in such away that allows DAKOTA to manage the computation of responses instead of APPS. Iterate and response values are passed between Dakota and APPSPACK via this interface.
8.7.2 Constructor & Destructor Documentation

8.7.2.1 APPSEvalMgr (Model & model)

Evaluation manager class for APPSPACK.

The APPSEvalMgr class is derived from APPSPACK’s Executor class. It implements the methods of that class in such a way that allows DAKOTA to manage the computation of responses instead of APPS. Iterate and response values are passed between Dakota and APPSPACK via this interface.

8.7.3 Member Function Documentation

8.7.3.1 bool isReadyForWork () const

tells APPS whether or not there is a processor available to perform a function evaluation

Check to see if all processors available for function evaluations are being used. If not, tell APPS that one is available.

8.7.3.2 bool submit (const int apps_tag, const HOPSPACK::Vector & apps_xtrial, HOPSPACK::EvalRequestType apps_request)

performs a function evaluation at APPS-provided x_in

Convert APPSPACK vector of variables to DAKOTA vector of variables and perform function evaluation asynchronously or not as specified in the DAKOTA input deck. If evaluation is asynchronous, map the dakota id to the APPS tag. If evaluation is synchronous, map the responses to the APPS tag.

8.7.3.3 int recv (int & apps_tag, HOPSPACK::Vector & apps_f, HOPSPACK::Vector & apps_cEqs, HOPSPACK::Vector & apps_cIneqs, string & apps_msg)

returns a function value to APPS

Retrieve a set of responses values, convert to APPS data structures, and return them to APPS. APPS tags are tied to corresponding responses using the appropriate (i.e., asynchronous or synchronous) map.

The documentation for this class was generated from the following files:

- APPSEvalMgr.H
- APPSEvalMgr.C
8.8 APPSOptimizer Class Reference

Wrapper class for APPSPACK.

  Performs the iterations to determine the optimal solution.

### Protected Member Functions

- **void set_apps_parameters** ()
  sets options for specific methods based on user specifications

- **void initialize_variables_and_constraints** ()
  initializes problem variables and constraints

### Protected Attributes

- **HOPSPACK::ParameterList params**
  Pointer to APPS parameter list.
8.8.1 Detailed Description

Wrapper class for APPSPACK.

The APPSOptimizer class provides a wrapper for APPSPACK, a Sandia-developed C++ library for generalized pattern search. APPSPACK defaults to a coordinate pattern search but also allows for augmented search patterns. It can solve problems with bounds, linear constraints, and general nonlinear constraints. APPSOptimizer uses an APPSEvalMgr object to manage the function evaluations.

The user input mappings are as follows: output max_function_evaluations, constraint_tol initial_delta, contraction_factor, threshold_delta, solution_target, synchronization, merit_function, constraint_penalty, and smoothing_factor are mapped into APPS's "Debug", "Maximum Evaluations", "Bounds Tolerance"/"Machine Epsilon"/"Constraint Tolerance", "Initial Step", "Contraction Factor", "Step Tolerance", "Function Tolerance", "Synchronous", "Method", "Initial Penalty Value", and "Initial Smoothing Value" data attributes. Refer to the APPS web site (http://software.sandia.gov/appspack) for additional information on APPS objects and controls.

8.8.2 Constructor & Destructor Documentation

8.8.2.1 APPSOptimizer (Model & model)

Wrapper class for HOPSPACK.
The **APPSOptimizer** class provides a wrapper for HOPSPACK, a Sandia-developed C++ library for generalized pattern search. HOPSPACK defaults to a coordinate pattern search but also allows for augmented search patterns. It can solve problems with bounds, linear constraints, and general nonlinear constraints. **APPSOptimizer** uses an **APPSEvalMgr** object to manage the function evaluations.

The user input mappings are as follows: `output max_function_evaluations, constraint_tol initial_delta, contraction_factor, threshold_delta, solution_target, synchronization, merit_function, constraint_penalty, and smoothing_factor` are mapped into HOPSPACK's "Display", "Maximum Evaluations", "Active Tolerance"/"Nonlinear Active Tolerance", "Initial Step", "Contraction Factor", "Step Tolerance", "Objective Target", "Synchronous Evaluations", "Penalty Function", "Penalty Parameter", and "Penalty Smoothing Value" data attributes. Refer to the HOPS web site ([https://software.sandia.gov/trac/hopspack](https://software.sandia.gov/trac/hopspack)) for additional information on HOPS objects and controls.

### 8.8.3 Member Function Documentation

#### 8.8.3.1 void find_optimum () [virtual]

Performs the iterations to determine the optimal solution.

find_optimum redefines the **Optimizer** virtual function to perform the optimization using HOPS. It first sets up the problem data, then executes minimize() on the HOPS optimizer, and finally catalogues the results.

Implements **Optimizer**.

#### 8.8.3.2 void set_apps_parameters () [protected]

sets options for specific methods based on user specifications

Set all of the HOPS algorithmic parameters as specified in the DAKOTA input deck. This is called at construction time.

#### 8.8.3.3 void initialize_variables_and_constraints () [protected]

initializes problem variables and constraints

Set the variables and constraints as specified in the DAKOTA input deck. This is done at run time.

The documentation for this class was generated from the following files:

- APPSOptimizer.H
- APPSOptimizer.C
8.9 BaseConstructor Struct Reference

Dummy struct for overloading letter-envelope constructors.

Public Member Functions

- **BaseConstructor**(int=0)

  C++ structs can have constructors.

8.9.1 Detailed Description

Dummy struct for overloading letter-envelope constructors.

**BaseConstructor** is used to overload the constructor for the base class portion of letter objects. It avoids infinite recursion (Coplien p.139) in the letter-envelope idiom by preventing the letter from instantiating another envelope. Putting this struct here avoids circular dependencies.

The documentation for this struct was generated from the following file:

- global_defs.h

• **BiStream** & operator\( \gg \) (unsigned short &s)
  
  Input operator, reads unsigned short from binary stream *BiStream*.

**Private Attributes**

• XDR xdrInBuf
  
  XDR input stream buffer.

• char inBuf [MAX_NETOBJ_SZ]
  
  Buffer to hold data as it is read in.

### 8.10.1 Detailed Description

data types

The *Dakota::BiStream* class is a binary input class which overloads the \( \gg \) operator for all standard data types (int, char, float, etc). The class relies on the methods within the ifstream base class. The *Dakota::BiStream* class inherits from the ifstream class. If available, the class utilize rpc/xdr to construct machine independent binary files. These *Dakota* restart files can be moved from host to host. The motivation to develop these classes was to replace the Rogue wave classes which *Dakota* historically used for binary I/O.

### 8.10.2 Constructor & Destructor Documentation

#### 8.10.2.1 BiStream ()

Default constructor, need to open.

Default constructor, allocates xdr stream, but does not call the open method. The open method must be called before stream can be read.

#### 8.10.2.2 BiStream (const char * s)

Constructor takes name of input file.

Constructor which takes a char* filename. Calls the base class open method with the filename and no other arguments. Also allocates the xdr stream.
8.10 BiStream Class Reference

8.10.2.3  **BiStream** (const char * s, std::ios_base::openmode mode)

Constructor takes name of input file, mode.
Constructor which takes a char* filename and int flags. Calls the base class open method with the filename and flags as arguments. Also allocates xdr stream.

8.10.2.4  ~BiStream ()

Destructor, calls xdr_destroy to delete xdr stream.
Destructor, destroys the xdr stream allocated in constructor

8.10.3  **Member Function Documentation**

8.10.3.1  **BiStream & operator>> (String & ds)**

Binary Input stream operator>>.
The String input operator must first read both the xdr buffer size and the size of the string written. Once these our read it can then read and convert the String correctly.

8.10.3.2  **BiStream & operator>>(char * s)**

Input operator, reads char* from binary stream BiStream.
Reading char array is a special case. The method has no way of knowing if the length to the input array is large enough, it assumes it is one char longer than actual string, (Null terminator added). As with the String the size of the xdr buffer as well as the char array size written must be read from the stream prior to reading and converting the char array.

The documentation for this class was generated from the following files:

- DakotaBinStream.H
- DakotaBinStream.C

  Output operator, writes unsigned int to binary stream BoStream.

- **BoStream** & operator<< (const unsigned long &l)
  
  Output operator, writes unsigned long to binary stream BoStream.

- **BoStream** & operator<< (const unsigned short &s)
  
  Output operator, writes unsigned short to binary stream BoStream.

**Private Attributes**

- **XDR xdrOutBuf**
  
  XDR output stream buffer.

- **char outBuf [MAX_NETOBJ_SZ]**
  
  Buffer to hold converted data before it is written.

8.11.1 Detailed Description

data types

The Dakota::BoStream class is a binary output classes which overloads the << operator for all standard data types (int, char, float, etc). The class relies on the built in write methods within the ostream base classes. Dakota::BoStream inherits from the ofstream class. The motivation to develop this class was to replace the Rogue wave class which Dakota historically used for binary I/O. If available, the class utilize rpc/xdr to construct machine independent binary files. These Dakota restart files can be moved between hosts.

8.11.2 Constructor & Destructor Documentation

8.11.2.1 **BoStream ()**

Default constructor, need to open.

Default constructor allocates the xdr stream but does not call the open() method. The open() method must be called before stream can be written to.

8.11.2.2 **BoStream (const char * s)**

Constructor takes name of input file.

Constructor, takes char * filename as argument. Calls base class open method with filename and no other arguments. Also allocates xdr stream
8.11.2.3  **BoStream (const char * s, std::ios_base::openmode mode)**

Constructor takes name of input file, mode.
Constructor, takes char * filename and int flags as arguments. Calls base class open method with filename and flags as arguments. Also allocates xdr stream. Note : If no rpc/xdr support xdr calls are #ifdef’d out.

8.11.3  **Member Function Documentation**

8.11.3.1  **BoStream & operator<< (const String & ds)**

Binary Output stream operator<<.
The String operator<< must first write the xdr buffer size and the original string size to the stream. The input operator needs this information to be able to correctly read and convert the String.

8.11.3.2  **BoStream & operator<< (const char * s)**

Output operator, writes char* TO binary stream BoStream.
The output of char* is the same as the output of the String. The size of the xdr buffer and the size of the string must be written first, then the string itself.
The documentation for this class was generated from the following files:

- DakotaBinStream.H
- DakotaBinStream.C
8.12 COLINApplication Class Reference

Public Member Functions

- **COLINApplication ()**
  Default constructor. Required by COLIN’s ApplicationHandle creation.

- **COLINApplication (Model &model)**
  Constructor with Model (not presently used).

- **~COLINApplication ()**
  Destructor.

- **void set_problem (Model &model)**
  Information from the Model and set it for COLIN.

- **void set_blocking_synch (const bool blockingSynchFlag)**
  Publishes whether or not COLIN is operating synchronously

- **virtual utilib::Any spawn_evaluation_impl (const utilib::Any &domain, const colin::AppRequest::request_map_t &requests, utilib::seed_t &seed)**
  Returning a DAKOTA-specific evaluation tracking ID.

- **virtual bool evaluation_available ()**
  Check to see if there are any function values ready to be collected.

- **virtual void perform_evaluation_impl (const utilib::Any &domain, const colin::AppRequest::request_map_t &requests, utilib::seed_t &seed, colin::AppResponse::response_map_t &colin_responses)**
  Perform a function evaluation at t given point.

- **virtual utilib::Any collect_evaluation_impl (colin::AppResponse::response_map_t &responses, utilib::seed_t &seed)**
  Collect a completed evaluation from DAKOTA.

- **virtual void colin_request_to_dakota_request (const utilib::Any &domain, const colin::AppRequest::request_map_t &requests, utilib::seed_t &seed)**
  Structures to DAKOTA structures.

- **virtual void dakota_response_to_colin_response (const Response &dakota_response, colin::AppResponse::response_map_t &colin_responses)**
  Structures to COLIN structures.

- **virtual bool map_domain (const utilib::Any &src, utilib::Any &native, bool forward=true) const**
  Map the domain point into data type desired by this application context.
Protected Attributes

- **Model iteratedModel**
  
  Shallow copy of the model on which COLIN will iterate.

- **bool blockingSynch**
  
  Flag for COLIN synchronous behavior (Pattern Search only).

- **ActiveSet activeSet**
  
  Local copy of model’s active set for convenience.

- **std::vector<int> requestedEvals**
  
  Evaluations queued for asynch evaluation.

- **IntResponseMap dakota_responses**
  
  eval_id to response mapping to cache completed jobs.

### 8.12.1 Detailed Description

**COLINApplication** is a DAKOTA class that is derived from COLIN’s Application hierarchy. It redefines a variety of virtual COLIN functions to use the corresponding DAKOTA functions. This is a more flexible algorithm library interfacing approach than can be obtained with the function pointer approaches used by NPSOLOptimizer and SNLLOptimizer.

### 8.12.2 Member Function Documentation

#### 8.12.2.1 void set_problem (Model & model)

Set variable bounds and linear and nonlinear constraints. This avoids using probDescDB, so it is called by both the standard and the on-the-fly **COLINOptimizer** constructors.

#### 8.12.2.2 utilib::Any spawn_evaluation_impl (const utilib::Any & domain, const colin::AppRequest::request_map_t & requests, utilib::seed_t & seed) [virtual]

returning a DAKOTA-specific evaluation tracking ID.

Schedule one or more requests at specified domain point, returning a DAKOTA-specific evaluation tracking ID. This is only called by COLIN’s concurrent evaluator, which is only instantiated when the **Model** supports asynch evals. The domain point is guaranteed to be compatible with data type specified by map_domain(...)  

#### 8.12.2.3 bool evaluation_available () [virtual]

Check to see if there are any function values ready to be collected.
Check to see if any asynchronous evaluations have finished. This is only called by COLIN’s concurrent evaluator, which is only instantiated when the Model supports asynch evals.

8.12.2.4 void perform_evaluation_impl (const utilib::Any & domain, const colin::AppRequest::request_map_t & requests, utilib::seed_t & seed, colin::AppResponse::response_map_t & colin_responses) [virtual]

Perform a function evaluation at \( t \) given point.
Perform an evaluation at a specified domain point. Wait for and return the response. This is only called by COLIN’s serial evaluator, which is only instantiated when the Model does not support asynch evals. The domain point is guaranteed to be compatible with data type specified by map_domain(...)

8.12.2.5 utilib::Any collect_evaluation_impl (colin::AppResponse::response_map_t & colin_responses, utilib::seed_t & seed) [virtual]

Collect a completed evaluation from DAKOTA.
Collect the next completed evaluation from DAKOTA. Always returns the evalid of the response returned.

8.12.2.6 void colin_request_to_dakota_request (const utilib::Any & domain, const colin::AppRequest::request_map_t & requests, utilib::seed_t & seed) [virtual]

structures to DAKOTA structures.
Map COLIN info requests to DAKOTA objectives and constraints.

8.12.2.7 void dakota_response_to_colin_response (const Response & dakota_response, colin::AppResponse::response_map_t & colin_responses) [virtual]

structures to COLIN structures.
Map DAKOTA objective and constraint values to COLIN response.

8.12.2.8 bool map_domain (const utilib::Any & src, utilib::Any & native, bool forward = true) const [virtual]

Map the domain point into data type desired by this application context.
Map the domain point into data type desired by this application context (utilib::MixedIntVars). This data type can be exposed from the Any &domain presented to spawn and collect.
The documentation for this class was generated from the following files:

- COLINApplication.H
- COLINApplication.C
8.13 COLINOptimizer Class Reference

Wrapper class for optimizers defined using COLIN.

Inheritance diagram for COLINOptimizer:

```
Iterator
    |
    Minimizer
    |
    Optimizer
    |
COLINOptimizer
```

Public Member Functions

- **COLINOptimizer (Model &model)**
  
  Default constructor.

- **COLINOptimizer (Model &model, int seed)**
  
  Alternate constructor for on-the-fly instantiations.

- **COLINOptimizer (NoDBBaseConstructor, Model &model)**
  
  Alternate constructor for Iterator instantiations by name.

- **~COLINOptimizer ()**
  
  Destructor

- **void find_optimum ()**
  
  iterates the COLIN solver to determine the optimal solution

### 8.13.1 Detailed Description

Wrapper class for optimizers defined using COLIN.

The **COLINOptimizer** class wraps COLIN, a Sandia-developed C++ optimization interface library. A variety of COLIN optimizers are defined in COLIN and its associated libraries, including SCOLIB which contains the...
optimization components from the old COLINY (formerly SGOPT) library. COLIN contains optimizers such as genetic algorithms, pattern search methods, and other nongradient-based techniques. COLINOptimizer uses a COLINApplication object to perform the function evaluations.

The user input mappings are as follows: max_iterations, max_function_evaluations, convergence_tolerance, and solution_accuracy are mapped into COLIN’s max_iterations, max_function_evaluations_this_trial, function_value_tolerance, sufficient_objective_value properties. An outputLevel is mapped to COLIN’s output_level property and a setting of debug activates output of method initialization and sets the COLIN debug attribute to 10000 for the DEBUG output level. Refer to [Hart, W.E., 2006] for additional information on COLIN objects and controls.

8.13.2 Member Function Documentation

8.13.2.1 void find_optimum () [virtual]

iterates the COLIN solver to determine the optimal solution

find_optimum redefines the Optimizer virtual function to perform the optimization using COLIN. It first sets up the problem data, then executes optimize() on the COLIN solver and finally catalogues the results.

Implements Optimizer.

8.13.2.2 void post_run (std::ostream & s) [protected, virtual]

function value

This overrides Optimizer::post_run(). Do this because we need to unscale variables in order to look responses up in the database.

Reimplemented from Optimizer.

The documentation for this class was generated from the following files:

- COLINOptimizer.H
- COLINOptimizer.C

  *outputs the DAKOTA version*
8.15.1 Detailed Description

Utility class for managing command line inputs to DAKOTA. 
CommandLineHandler provides additional functionality that is specific to DAKOTA’s needs for the definition and parsing of command line options. Inheritance is used to allow the class to have all the functionality of the base class, GetLongOpt.

8.15.2 Member Function Documentation

8.15.2.1 bool instantiate_flag () const [inline]

Whether command line args dictate instantiation of objects for run. 
Instantiate objects if not just getting help or version

Private Attributes

- std::string sysCommand
  
  insertions and then executed by flush

- bool asynchFlag
  
  flags nonblocking operation (background system calls)

- bool suppressOutputFlag
  
  flags suppression of shell output (no command echo)

8.16.1 Detailed Description

processes with system calls.

The CommandShell class wraps the C system() utility and defines convenience operators for building a command string and then passing it to the shell.

8.16.2 Member Function Documentation

8.16.2.1 CommandShell & flush ()

"flushes" the shell; i.e. executes the sysCommand

Executes the sysCommand by passing it to system(). Appends an "&" if asynchFlag is set (background system call) and echos the sysCommand to Cout if suppressOutputFlag is not set.

The documentation for this class was generated from the following files:

- CommandShell.H

8.17 ConcurrentStrategy Class Reference

Strategy for multi-start iteration or pareto set optimization.

Inheritance diagram for ConcurrentStrategy::

```
Strategy
  
ConcurrentStrategy
```

Public Member Functions

- **ConcurrentStrategy** (ProblemDescDB &problem_db)
  constructor
- **~ConcurrentStrategy**()
  destructor

Protected Member Functions

- void **run_strategy**()
  settings within the iterator or model.
- void **initialize_iterator** (int job_index)
  scheduling function (serve_iterators() or static_schedule_iterators())
- void **pack_parameters_buffer** (MPIPackBuffer &send_buffer, int job_index)
  pack a send_buffer for assigning an iterator job to a server
- void **unpack_parameters_buffer** (MPIUnpackBuffer &recv_buffer)
  unpack a recv_buffer for accepting an iterator job from the scheduler
- void **pack_results_buffer** (MPIPackBuffer &send_buffer, int job_index)
  pack a send_buffer for returning iterator results from a server
- void **unpack_results_buffer** (MPIUnpackBuffer &recv_buffer, int job_index)
  unpack a recv_buffer for accepting iterator results from a server
- void **update_local_results** (int job_index)
  update local PRP results arrays with current iteration results
Private Member Functions

- void initialize_iterator (const RealVector &param_set)
  
  initialize_iterator(int) to update userDefinedModel and selectedIterator

- void print_results () const
  
  prints the concurrent iteration results summary (called by run_strategy())

Private Attributes

- Model userDefinedModel
  
  the model used by the iterator

- Iterator selectedIterator
  
  the iterator used by the concurrent strategy

- bool multiStartFlag
  
  distinguishes multi-start from Pareto-set

- RealVector initialPt
  
  point in the Pareto set strategy

- RealVectorArray parameterSets
  
  be performed.

- PRPArray prpResults
  
  1-d array of ParamResponsePair results corresponding to numIteratorJobs

8.17.1 Detailed Description

Strategy for multi-start iteration or pareto set optimization.

This strategy maintains two concurrent iterator capabilities. First, a general capability for running an iterator multiple times from different starting points is provided (often used for multi-start optimization, but not restricted to optimization). Second, a simple capability for mapping the "pareto frontier" (the set of optimal solutions in multiobjective formulations) is provided. This pareto set is mapped through running an optimizer multiple times for different sets of multiobjective weightings.

8.17.2 Member Function Documentation

8.17.2.1 void pack_parameters_buffer (MPIPackBuffer &send_buffer, int job_index) [inline, protected, virtual]

pack a send_buffer for assigning an iterator job to a server
This virtual function redefinition is executed on the dedicated master processor for self scheduling. It is not used for peer partitions.
Reimplemented from Strategy.

8.17.2.2 void unpack_parameters_buffer (MPIUnpackBuffer & recv_buffer) [inline, protected, virtual]

unpack a recv_buffer for accepting an iterator job from the scheduler
This virtual function redefinition is executed on an iterator server for dedicated master self scheduling. It is not used for peer partitions.
Reimplemented from Strategy.

8.17.2.3 void pack_results_buffer (MPIPackBuffer & send_buffer, int job_index) [inline, protected, virtual]

pack a send_buffer for returning iterator results from a server
This virtual function redefinition is executed either on an iterator server for dedicated master self scheduling or on peers 2 through n for static scheduling.
Reimplemented from Strategy.

8.17.2.4 void unpack_results_buffer (MPIUnpackBuffer & recv_buffer, int job_index) [inline, protected, virtual]

unpack a recv_buffer for accepting iterator results from a server
This virtual function redefinition is executed on an strategy master (either the dedicated master processor for self scheduling or peer 1 for static scheduling).
Reimplemented from Strategy.

8.18.1 Detailed Description

Wrapper class for the CONMIN optimization library.

The CONMINOptimizer class provides a wrapper for CONMIN, a Public-domain Fortran 77 optimization library written by Gary Vanderplaats under contract to NASA Ames Research Center. The CONMIN User’s Manual is contained in NASA Technical Memorandum X-62282, 1978. CONMIN uses a reverse communication mode, which avoids the static member function issues that arise with function pointer designs (see NPSOLOptimizer and SNLLOptimizer).

The user input mappings are as follows: max_iterations is mapped into CONMIN’s ITMAX parameter, max_function_evaluations is implemented directly in the find_optimum() loop since there is no CONMIN parameter equivalent, convergence_tolerance is mapped into CONMIN’s DELFUN and DABFUN parameters, output verbosity is mapped into CONMIN’s IPRINT parameter (verbose: IPRINT = 4; quiet: IPRINT = 2), gradient mode is mapped into CONMIN’s NFDP parameter, and finite difference step size is mapped into CONMIN’s FDCH and FDCHM parameters. Refer to [Vanderplaats, 1978] for additional information on CONMIN parameters.

8.18.2 Member Data Documentation

8.18.2.1 int conminInfo [private]

INFO from CONMIN manual.

Information requested by CONMIN: 1 = evaluate objective and constraints, 2 = evaluate gradients of objective and constraints.

8.18.2.2 int printControl [private]

IPRINT from CONMIN manual (controls output verbosity).

Values range from 0 (nothing) to 4 (most output). 0 = nothing, 1 = initial and final function information, 2 = all of #1 plus function value and design vars at each iteration, 3 = all of #2 plus constraint values and direction vectors, 4 = all of #3 plus gradients of the objective function and constraints, 5 = all of #4 plus proposed design vector, plus objective and constraint functions from the 1-D search

8.18.2.3 int optimizationType [private]

MINMAX from DOT manual (minimize or maximize).

Values of 0 or -1 (minimize) or 1 (maximize).

8.18.2.4 RealVector constraintValues [private]

array of nonlinear constraint values passed to CONMIN

This array must be of nonzero length and must contain only one-sided inequality constraints which are <= 0 (which requires a transformation from 2-sided inequalities and equalities).
8.18.2.5 SizetArray `constraintMappingIndices` [private]

Response constraints used in computing the CONMIN constraints.
The length of the container corresponds to the number of CONMIN constraints, and each entry in the container points to the corresponding DAKOTA constraint.

8.18.2.6 RealArray `constraintMappingMultipliers` [private]

the CONMIN constraints.
The length of the container corresponds to the number of CONMIN constraints, and each entry in the container stores a multiplier for the DAKOTA constraint identified with `constraintMappingIndices`. These multipliers are currently +1 or -1.

8.18.2.7 RealArray `constraintMappingOffsets` [private]

CONMIN constraints.
The length of the container corresponds to the number of CONMIN constraints, and each entry in the container stores an offset for the DAKOTA constraint identified with `constraintMappingIndices`. These offsets involve inequality bounds or equality targets, since CONMIN assumes constraint allowables = 0.

8.18.2.8 int `N1` [private]

Size variable for CONMIN arrays. See CONMIN manual.
N1 = number of variables + 2

8.18.2.9 int `N2` [private]

Size variable for CONMIN arrays. See CONMIN manual.
N2 = number of constraints + 2∗(number of variables)

8.18.2.10 int `N3` [private]

Size variable for CONMIN arrays. See CONMIN manual.
N3 = Maximum possible number of active constraints.

8.18.2.11 int `N4` [private]

Size variable for CONMIN arrays. See CONMIN manual.
N4 = Maximum(N3,number of variables)
8.18.2.12 int N5 [private]
Size variable for CONMIN arrays. See CONMIN manual.
N5 = 2*(N4)

8.18.2.13 double CT [private]
Constraint thickness parameter.
The value of CT decreases in magnitude during optimization.

8.18.2.14 double* S [private]
Internal CONMIN array.
Move direction in N-dimensional space.

8.18.2.15 double* G1 [private]
Internal CONMIN array.
Temporary storage of constraint values.

8.18.2.16 double* G2 [private]
Internal CONMIN array.
Temporary storage of constraint values.

8.18.2.17 double* B [private]
Internal CONMIN array.
Temporary storage for computations involving array S.

8.18.2.18 double* C [private]
Internal CONMIN array.
Temporary storage for use with arrays B and S.

8.18.2.19 int* MS1 [private]
Internal CONMIN array.
Temporary storage for use with arrays B and S.
8.18.2.20 double* SCAL [private]
Internal CONMIN array.
Vector of scaling parameters for design parameter values.

8.18.2.21 double* DF [private]
Internal CONMIN array.
Temporary storage for analytic gradient data.

8.18.2.22 double* A [private]
Internal CONMIN array.
Temporary 2-D array for storage of constraint gradients.

8.18.2.23 int* ISC [private]
Internal CONMIN array.
Array of flags to identify linear constraints. (not used in this implementation of CONMIN)

8.18.2.24 int* IC [private]
Internal CONMIN array.
Array of flags to identify active and violated constraints
The documentation for this class was generated from the following files:

- CONMINOptimizer.H
- CONMINOptimizer.C

### 8.19.1 Detailed Description

Base class for the variable constraints class hierarchy.

The `Constraints` class is the base class for the class hierarchy managing bound, linear, and nonlinear constraints. Using the variable lower and upper bounds arrays from the input specification, different derived classes define different views of this data. The linear and nonlinear constraint data is consistent in all views and is managed at the base class level. For memory efficiency and enhanced polymorphism, the variable constraints hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (`Constraints`) serves as the envelope and one of the derived classes (selected in `Constraints::get_constraints()`) serves as the letter.

### 8.19.2 Constructor & Destructor Documentation

#### 8.19.2.1 Constraints ()

default constructor

The default constructor: constraintsRep is NULL in this case (a populated problem_db is needed to build a meaningful `Constraints` object). This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.
8.19.2.2 **Constraints** (const ProblemDescDB & problem_db, const SharedVariablesData & svd)

standard constructor

The envelope constructor only needs to extract enough data to properly execute get_constraints, since the constructor overloaded with BaseConstructor builds the actual base class data inherited by the derived classes.

8.19.2.3 **Constraints** (const SharedVariablesData & svd)

alternate constructor for instantiations on the fly

Envelope constructor for instantiations on the fly. This constructor executes get_constraints(view), which invokes the default derived/base constructors, followed by a reshape() based on vars_comps.

8.19.2.4 **Constraints** (const Constraints & con)

copy constructor

Copy constructor manages sharing of constraintsRep and incrementing of referenceCount.

8.19.2.5 ~**Constraints** () [virtual]

destructor

Destructor decrements referenceCount and only deletes constraintsRep when referenceCount reaches zero.

8.19.2.6 **Constraints** (BaseConstructor, const ProblemDescDB & problem_db, const SharedVariablesData & svd) [protected]

derived class constructors - Coplien, p. 139)

This constructor is the one which must build the base class data for all derived classes. get_constraints() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid recursion in the base class constructor calling get_constraints() again). Since the letter IS the representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in ~Constraints).

8.19.2.7 **Constraints** (BaseConstructor, const SharedVariablesData & svd) [protected]

derived class constructors - Coplien, p. 139)

This constructor is the one which must build the base class data for all derived classes. get_constraints() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid recursion in the base class constructor calling get_constraints() again). Since the letter IS the representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in ~Constraints).
8.19.3 Member Function Documentation

8.19.3.1 Constraints operator= (const Constraints & con)

assignment operator

8.19.3.2 void reshape (const SizetArray & vc_totals) [virtual]

reshape the lower/upper bound arrays within the Constraints hierarchy
Resizes the derived bounds arrays.
Reimplemented in MergedConstraints, and MixedConstraints.

8.19.3.3 Constraints copy () const

for use when a deep copy is needed (the representation is _not_ shared)
Deep copies are used for history mechanisms that catalogue permanent copies (should not change as the representation within userDefinedConstraints changes).

8.19.3.4 void reshape (const size_t & num_nln_ineq_cons, const size_t & num_nln_eq_cons, const size_t & num_lin_ineq_cons, const size_t & num_lin_eq_cons)

Constraints hierarchy.
Resizes the linear and nonlinear constraint arrays at the base class. Does NOT currently resize the derived bounds arrays.

8.19.3.5 void build_views () [inline, protected]

construct active/inactive views of all variables arrays
= EMPTY)
= EMPTY)

8.19.3.6 void manage_linear_constraints (const ProblemDescDB & problem_db) [protected]

coefficient input to matrices, and assign defaults
Convenience function called from derived class constructors. The number of variables active for applying linear constraints is currently defined to be the number of active continuous variables plus the number of active discrete variables (the most general case), even though very few optimizers can currently support mixed variable linear constraints.
8.19.3.7  **Constraints** ∗ get_constraints (const ProblemDescDB & problem_db, const SharedVariablesData & svd) [private]

appropriate derived type.
Initializes constraintsRep to the appropriate derived type, as given by the variables view.

8.19.3.8  **Constraints** ∗ get_constraints (const SharedVariablesData & svd) const [private]

derived type.
Initializes constraintsRep to the appropriate derived type, as given by the variables view. The default derived class constructors are invoked.

8.21.1 Detailed Description

data fit surrogates (global and local)
The DataFitSurrModel class manages global or local approximations (surrogates that involve data fits) that are used in place of an expensive model. The class contains an approxInterface (required for both global and local) which manages the approximate function evaluations, an actualModel (optional for global, required for local) which provides truth evaluations for building the surrogate, and a daceIterator (optional for global, not used for local) which selects parameter sets on which to evaluate actualModel in order to generate the necessary data for building global approximations.

8.21.2 Member Function Documentation

8.21.2.1 void derived_compute_response (const ActiveSet & set)  [protected, virtual]
portion of compute_response() specific to DataFitSurrModel
Compute the response synchronously using actualModel, approxInterface, or both (mixed case). For the approxInterface portion, build the approximation if needed, evaluate the approximate response, and apply correction (if active) to the results.
Reimplemented from Model.

8.21.2.2 void derived_asynch_compute_response (const ActiveSet & set)  [protected, virtual]
portion of asynch_compute_response() specific to DataFitSurrModel
Compute the response asynchronously using actualModel, approxInterface, or both (mixed case). For the approxInterface portion, build the approximation if needed and evaluate the approximate response in a quasi-asynchronous approach (ApproximationInterface::map() performs the map synchronously and bookkeeps the results for return in derived_synchronize() below).
Reimplemented from Model.

8.21.2.3 const IntResponseMap & derived_synchronize ()  [protected, virtual]
portion of synchronize() specific to DataFitSurrModel
Blocking retrieval of asynchronous evaluations from actualModel, approxInterface, or both (mixed case). For the approxInterface portion, apply correction (if active) to each response in the array. derived_synchronize() is designed for the general case where derived_asynch_compute_response() may be inconsistent in its use of actual evaluations, approximate evaluations, or both.
Reimplemented from Model.

8.21.2.4 const IntResponseMap & derived_synchronize_nowait ()  [protected, virtual]
portion of synchronize_nowait() specific to DataFitSurrModel
Nonblocking retrieval of asynchronous evaluations from actualModel, approxInterface, or both (mixed case). For the approxInterface portion, apply correction (if active) to each response in the map. derived_synchronize_nowait() is designed for the general case where derived_asynch_compute_response() may be inconsistent in its use of actual evaluations, approximate evaluations, or both.
nowait() is designed for the general case where derived_asynch_compute_response() may be inconsistent in its use of actual evals, approx evals, or both.

Reimplemented from Model.

8.21.2.5  void build_approximation ()  [protected, virtual]
daceIterator/actualModel to generate new data points
This function constructs a new approximation, discarding any previous data. It constructs any required currentPoints and does not define an anchorPoint.
Reimplemented from Model.

8.21.2.6  bool build_approximation (const Variables & vars, const Response & response)  [protected, virtual]

augment the vars/response anchor point
This function constructs a new approximation, discarding any previous data. It uses the passed data to populate the anchorPoint and constructs any required currentPoints.
Reimplemented from Model.

8.21.2.7  void update_approximation (bool rebuild_flag)  [protected, virtual]

if requested
This function populates/replaces Approximation::anchorPoint and rebuilds the approximation, if requested. It does not clear other data (i.e., Approximation::currentPoints) and does not update the actualModel with revised bounds, labels, etc. Thus, it updates data from a previous call to build_approximation(), and is not intended to be used in isolation.
Reimplemented from Model.

8.21.2.8  void update_approximation (const Variables & vars, const Response & response, bool rebuild_flag)  [protected, virtual]

replaces the anchor point, and rebuilds the approximation if requested
This function populates/replaces Approximation::anchorPoint and rebuilds the approximation, if requested. It does not clear other data (i.e., Approximation::currentPoints) and does not update the actualModel with revised bounds, labels, etc. Thus, it updates data from a previous call to build_approximation(), and is not intended to be used in isolation.
Reimplemented from Model.

8.21.2.9  void update_approximation (const VariablesArray & vars_array, const ResponseArray & resp_array, bool rebuild_flag)  [protected, virtual]

if requested
This function populates/replaces \texttt{Approximation::currentPoints} and rebuilds the approximation, if requested. It does not clear other data (i.e., \texttt{Approximation::anchorPoint}) and does not update the actualModel with revised bounds, labels, etc. Thus, it updates data from a previous call to \texttt{build_approximation()}, and is not intended to be used in isolation.

Reimplemented from \texttt{Model}.

\texttt{8.21.2.10 void append_approximation (bool rebuild_flag) [protected, virtual]}

appends data to a global approximation and rebuilds it if requested

This function appends one point to \texttt{Approximation::currentPoints} and rebuilds the approximation, if requested. It does not modify other data (i.e., \texttt{Approximation::anchorPoint}) and does not update the actualModel with revised bounds, labels, etc. Thus, it appends to data from a previous call to \texttt{build_approximation()}, and is not intended to be used in isolation.

Reimplemented from \texttt{Model}.

\texttt{8.21.2.11 void append_approximation (const Variables & vars, const Response & response, bool rebuild_flag) [protected, virtual]}

appends a point to a global approximation and rebuilds it if requested

This function appends one point to \texttt{Approximation::currentPoints} and rebuilds the approximation, if requested. It does not modify other data (i.e., \texttt{Approximation::anchorPoint}) and does not update the actualModel with revised bounds, labels, etc. Thus, it appends to data from a previous call to \texttt{build_approximation()}, and is not intended to be used in isolation.

Reimplemented from \texttt{Model}.

\texttt{8.21.2.12 void append_approximation (const VariablesArray & vars_array, const ResponseArray & resp_array, bool rebuild_flag) [protected, virtual]}

if requested

This function appends multiple points to \texttt{Approximation::currentPoints} and rebuilds the approximation, if requested. It does not modify other data (i.e., \texttt{Approximation::anchorPoint}) and does not update the actualModel with revised bounds, labels, etc. Thus, it appends to data from a previous call to \texttt{build_approximation()}, and is not intended to be used in isolation.

Reimplemented from \texttt{Model}.

\texttt{8.21.2.13 void derived_init_communicators (const int & max_iterator_concurrency, bool recurse_flag = true) [inline, protected, virtual]}

set up actualModel for parallel operations

asynchronous flags need to be initialized for the sub-models. In addition, max_iterator_concurrency is the outer level iterator concurrency, not the DACE concurrency that actualModel will see, and recomputing the message-lengths on the sub-model is probably not a bad idea either. Therefore, recompute everything on actualModel using init_communicators.
Reimplemented from Model.

8.21.2.14 int evaluation_id () const [inline, protected, virtual]

return the current evaluation id for the DataFitSurrModel
return the DataFitSurrModel evaluation count. Due to possibly intermittent use of surrogate bypass, this is not the same as either the approxInterface or actualModel model evaluation counts. It also does not distinguish duplicate evals.
Reimplemented from Model.

8.21.2.15 void build_global () [private]

Builds a global approximation using daceIterator.
Determine points to use in building the approximation and then evaluate them on actualModel using daceIterator. Any changes to the bounds should be performed by setting them at a higher level (e.g., SurrBasedOptStrategy).

8.21.2.16 void build_local_multipoint () [private]

Builds a local or multipoint approximation using actualModel.
Evaluate the value, gradient, and possibly Hessian needed for a local or multipoint approximation using actualModel.

8.21.2.17 void update_actual_model () [private]

update actualModel with data from current variables/labels/bounds/targets
Update variables and constraints data within actualModel using values and labels from currentVariables and bound/linear/nonlinear constraints from userDefinedConstraints.

8.21.2.18 void update_from_actual_model () [private]

update current variables/labels/bounds/targets with data from actualModel
Update values and labels in currentVariables and bound/linear/nonlinear constraints in userDefinedConstraints from variables and constraints data within actualModel.

8.21.3 Member Data Documentation

8.21.3.1 Model actualModel [private]

(optional for global, required for local)
actualModel is unrestricted in type; arbitrary nestings are possible.
The documentation for this class was generated from the following files:
• DataFitSurrModel.H
• DataFitSurrModel.C

8.22.1 Detailed Description

Handle class for interface specification data.

The DataInterface class is used to provide a memory management handle for the data in DataInterfaceRep. It is populated by IDRProblemDescDB::interface_kwhandler() and is queried by the ProblemDescDB::get_<datatype>() functions. A list of DataInterface objects is maintained in ProblemDescDB::dataInterfaceList, one for each interface specification in an input file.

8.22.2 Friends And Related Function Documentation

8.22.2.1 void run_dakota_data () [friend]

mode 2: direct Data class instantiation.

Rather than parsing from an input file, this function populates Data class objects directly using a minimal specification and relies on constructor defaults and post-processing in post_process() to fill in the rest.

The documentation for this class was generated from the following files:

- DataInterface.H
- DataInterface.C
8.23 DataMethod Class Reference

Handle class for method specification data.

Public Member Functions

- `DataMethod()`
  constructor
- `DataMethod(const DataMethod&)`
  copy constructor
- `~DataMethod()`
  destructor
- `DataMethod& operator=(const DataMethod&)`
  assignment operator
- `void write(std::ostream&) const`
  write a `DataMethod` object to an `std::ostream`
- `void read(MPIUnpackBuffer&)`
  read a `DataMethod` object from a packed MPI buffer
- `void write(MPIPackBuffer&) const`
  write a `DataMethod` object to a packed MPI buffer

Static Public Member Functions

  mode 2: direct Data class instantiation.
8.23.1 Detailed Description

Handle class for method specification data.

The `DataMethod` class is used to provide a memory management handle for the data in `DataMethodRep`. It is populated by IDRProblemDescDB::method_kwhandler() and is queried by the ProblemDescDB::get_<datatype>() functions. A list of `DataMethod` objects is maintained in ProblemDescDB::dataMethodList, one for each method specification in an input file.

8.23.2 Friends And Related Function Documentation

8.23.2.1 void run_dakota_data () [friend]

mode 2: direct Data class instantiation.

Rather than parsing from an input file, this function populates Data class objects directly using a minimal specification and relies on constructor defaults and post-processing in post_process() to fill in the rest.

The documentation for this class was generated from the following files:

- DataMethod.H
- DataMethod.C

  MethodCOLINYPS

• bool randomizeOrderFlag
  the stochastic specification for the PS method in MethodCOLINYPS

• String selectionPressure
  the fitness_type specification for EA methods in MethodCOLINYEA

• String replacementType
  MethodCOLINYEA

• String crossoverType
  the crossover_type specification for EA methods in MethodCOLINYEA

• String mutationType
  the mutation_type specification for EA methods in MethodCOLINYEA

• String exploratoryMoves
  MethodCOLINYPS

• String patternBasis
  MethodAPPS and MethodCOLINYPS

• size_t numCrossPoints
  The number of crossover points or multi-point schemes.

• size_t numParents
  The number of parents to use in a crossover operation.

• size_t numOffspring
  The number of children to produce in a crossover operation.

• String fitnessType
  the fitness assessment operator to use.

• String convergenceType
  The means by which this JEGA should converge.

• Real percentChange
  for a fitness tracker converger.

• size_t numGenerations
  tracker converger should track.
• Real fitnessLimit
  below_limit selector).

• Real shrinkagePercent
  must take place on each call to the selector (0, 1).

• String nichingType
  The niching type.

• RealVector nicheVector
  The discretization percentage along each objective.

• String postProcessorType
  The post processor type.

• RealVector distanceVector
  The discretization percentage along each objective.

• String initializationType
  The means by which the JEGA should initialize the population.

• String flatFile
  The filename to use for initialization.

• String logFile
  The filename to use for logging.

• int populationSize
  MethodCOLINYEA.

• bool printPopFlag
  at each generation

• Real volBoxSize
  the volume_boxsize_limit for the DIRECT method in MethodNCSUDC

• int numSymbols
  the symbols specification for DACE methods

• bool mainEffectsFlag
  in MethodDDACE)

• bool latinizeFlag
  MethodFSUDACE

• bool volQualityFlag
and CVT methods in MethodFSUDACE)

- **IntVector sequenceStart**
  - the `sequenceStart` specification in MethodFSUDACE

- **IntVector sequenceLeap**
  - the `sequenceLeap` specification in MethodFSUDACE

- **IntVector primeBase**
  - the `primeBase` specification in MethodFSUDACE

- **int numTrials**
  - the `numTrials` specification in MethodFSUDACE

- **String trialType**
  - the `trial_type` specification in MethodFSUDACE

- **int randomSeed**
  - the seed specification for COLINY, NonD, & DACE methods

- **int numSamples**
  - the `samples` specification for NonD & DACE methods

- **bool fixedSeedFlag**
  - stencil/pattern throughout a strategy with repeated sampling.

- **bool fixedSequenceFlag**
  - stencil/pattern throughout a strategy with repeated sampling.

- **int previousSamples**
  - the number of previous samples when augmenting a LHS sample

- **bool vbdFlag**
  - the `var_based_decomp` specification for a variety of sampling methods

- **short vbdControl**
  - main/interaction/total effects

- **Real vbdDropTolerance**
  - the `var_based_decomp` tolerance for omitting index output

- **String rngName**
  - the basic random-number generator for NonD

- **short refinementType**
  - keyword group
• short refinementControl
  keyword group

• short nestingOverride
  refinement type for stochastic expansions from refinement keyword

• short expansionType
  ASKEY_U or STD_NORMAL_U based on input keywords askey or wiener.

• int expansionTerms
  the expansion_terms specification in MethodNonDPCE

• UShortArray expansionOrder
  the expansion_order specification in MethodNonDPCE

• int expansionSamples
  the expansion_samples specification in MethodNonDPCE

• String expansionSampleType
  incremental_lhs specification in MethodNonDPCE

• UShortArray quadratureOrder
  MethodNonDSC

• unsigned short sparseGridLevel
  MethodNonDSC

• unsigned short cubIntOrder
  the cubature_integrand specification in MethodNonDPCE

• RealVector sparseGridDimPref
  MethodNonDPCE and MethodNonDSC

• int collocationPoints
  the collocation_points specification in MethodNonDPCE

• Real collocationRatio
  the collocation_ratio specification in MethodNonDPCE

• String collocPtReuse
  reuse_points specification in MethodNonDPCE

• bool expansionDerivUsageFlag
  specification in MethodNonDPCE

8.29.1 Detailed Description

Handle class for strategy specification data.
The `DataStrategy` class is used to provide a memory management handle for the data in `DataStrategyRep`. It is populated by `IDRProblemDescDB::strategy_kwhandler()` and is queried by the `ProblemDescDB::get_<datatype>()` functions. A single `DataStrategy` object is maintained in `ProblemDescDB::strategySpec`.

The documentation for this class was generated from the following files:

- DataStrategy.H
- DataStrategy.C
8.30 DataStrategyRep Class Reference

Body class for strategy specification data.

8.31.1 Detailed Description

Handle class for variables specification data.

The DataVariables class is used to provide a memory management handle for the data in DataVariablesRep.
It is populated by IDRProblemDescDB::variables_kwhandler() and is queried by the ProblemDescDB::get_<-<datatype>() functions. A list of DataVariables objects is maintained in ProblemDescDB::dataVariablesList, one for each variables specification in an input file.

8.31.2 Friends And Related Function Documentation

8.31.2.1 void run_dakota_data () [friend]

mode 2: direct Data class instantiation.

Rather than parsing from an input file, this function populates Data class objects directly using a minimal specification and relies on constructor defaults and post-processing in post_process() to fill in the rest.

The documentation for this class was generated from the following files:
• DataVariables.H
• DataVariables.C

  oas, lhs, oa_lhs, random, box_behnken, central_composite, or grid

• int samplesSpec
  
  initial specification of number of samples

• int symbolsSpec
  
  initial specification of number of symbols

• int numSamples
  
  current number of samples to be evaluated

• int numSymbols
  
  (inversely related to number of replications)

• const int seedSpec
  
  (allows repeatable results)

• int randomSeed
  
  current seed for the random number generator

• bool allDataFlag
  
  Iterator::all_variables() and Iterator::all_responses().
• size_t numDACERuns  
  counter for number of run() executions for this object

• bool varyPattern  
  multiple executions are repeatable but not correlated.

• bool mainEffectsFlag  
  flag which specifies main effects

• std::vector<std::vector<int>> symbolMapping  
  mapping of symbols for main effects calculations

8.33.1 Detailed Description

Wrapper class for the DDACE design of experiments library.

The DDACEDesignCompExp class provides a wrapper for DDACE, a C++ design of experiments library from the Computational Sciences and Mathematics Research (CSMR) department at Sandia’s Livermore CA site. This class uses design and analysis of computer experiments (DACE) methods to sample the design space spanned by the bounds of a Model. It returns all generated samples and their corresponding responses as well as the best sample found.

8.33.2 Constructor & Destructor Documentation

8.33.2.1 DDACEDesignCompExp (Model & model)

primary constructor for building a standard DACE iterator

This constructor is called for a standard iterator built with data from probDescDB.

8.33.2.2 DDACEDesignCompExp (Model & model, int samples, int symbols, int seed, const String & sampling_method)

alternate constructor used for building approximations

This alternate constructor is used for instantiations on-the-fly, using only the incoming data. No problem description database queries are used.

8.33.3 Member Function Documentation

8.33.3.1 void pre_run () [virtual]

which can generate all Variables (parameter sets) a priori
pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated
into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest
parent's `pre_run()`, if implemented, typically _before_ performing its own implementation steps.
Reimplemented from `Iterator`.

### 8.33.3.2 `void post_run (std::ostream & s)` [virtual]

perform final analysis phase in a standalone way

Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely inte-
grated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent's
`post_run()`, typically _after_ performing its own implementation steps.
Reimplemented from `Iterator`.

### 8.33.3.3 `int num_samples () const` [inline, virtual]

get the current number of samples

Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be
costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden
by derived classes.
Reimplemented from `Iterator`.

### 8.33.3.4 `void resolve_samples_symbols ()` [private]

number of symbols from input.

This function must define a combination of samples and symbols that is acceptable for a particular sampling
algorithm. Users provide requests for these quantities, but this function must enforce any restrictions imposed by
the sampling algorithms.

The documentation for this class was generated from the following files:

• bool python_convert (const RealVector &c_src, const IntVector &di_src, const RealVector &dr_src, PyObject **dst)
  or numpy double array

• bool python_convert (const StringMultiArray &src, PyObject **dst)
  convert labels

• bool python_convert (const StringMultiArray &c_src, const StringMultiArray &di_src, const StringMultiArray &dr_src, PyObject **dst)
  convert all labels to single list

• bool python_convert (PyObject *pyv, RealVector &rv, const int &dim)
  RealVector (for fns).

• bool python_convert (PyObject *pyv, double *rv, const int &dim)
  double[], for use as helper in converting gradients

• bool python_convert (PyObject *pym, RealMatrix &rm)
to RealMatrix (for gradients)

- bool python_convert (PyObject *pym, RealSymMatrix &rm)
  to RealMatrix (used as helper in Hessian conversion)

- bool python_convert (PyObject *pym, RealSymMatrixArray &rma)
  [numpy array of double] to RealSymMatrixArray (for Hessians)

Private Attributes

- bool userNumpyFlag
  whether the user requested numpy data structures

8.34.1 Detailed Description

and testers using direct procedure calls.

DirectApplicInterface uses a few linkable simulation codes and several internal member functions to perform parameter to response mappings.

8.34.2 Member Function Documentation

8.34.2.1 int derived_synchronous_local_analysis (const int & analysis_id) [inline, virtual]

This code provides the derived function used by ApplicationInterface::serve_analyses_synch().
Reimplemented from ApplicationInterface.

8.34.2.2 int derived_map_ac (const Dakota::String & ac_name) [protected, virtual]

execute an analysis code portion of a direct evaluation invocation

When a direct analysis/filter is a member function, the (vars,set,response) data does not need to be passed through the API. If, however, non-member analysis/filter functions are added, then pass (vars,set,response) through to the non-member fns:

```c++
// API declaration
int sim(const Variables& vars, const ActiveSet& set, Response& response);
// use of API within derived_map_ac()
if (ac_name == "sim")
  fail_code = sim(directFnVars, directFnActSet, directFnResponse);
```

Reimplemented in ParallelDirectApplicInterface, and SerialDirectApplicInterface.
8.34.2.3  bool python_convert_int (const ArrayT & src, Size sz, PyObject ** dst) [private]

convert arrays of integer types to Python list or numpy array
convert all integer array types including IntVector, ShortArray, and SizetArray to Python list of ints or numpy array of ints

  real work space for DOT
8.35.1 Detailed Description

Wrapper class for the DOT optimization library.

The DOTOptimizer class provides a wrapper for DOT, a commercial Fortran 77 optimization library from Vanderplaats Research and Development. It uses a reverse communication mode, which avoids the static member function issues that arise with function pointer designs (see NPSOLUMinimizer and SNLLOptimizier).

The user input mappings are as follows: max_iterations is mapped into DOT’s ITMAX parameter within its IPRM array, max_function_evaluations is implemented directly in the find_optimum() loop since there is no DOT parameter equivalent, convergence_tolerance is mapped into DOT’s DELOBJ parameter (the relative convergence tolerance) within its RPRM array, output verbosity is mapped into DOT’s IPRINT parameter within its function call parameter list (verbose: IPRINT = 7; quiet: IPRINT = 3), and optimization_type is mapped into DOT’s MINMAX parameter within its function call parameter list. Refer to [Vanderplaats Research and Development, 1995] for information on IPRM, RPRM, and the DOT function call parameter list.

8.35.2 Member Data Documentation

8.35.2.1 int dotInfo [private]

INFO from DOT manual.

Information requested by DOT: 0=optimization complete, 1=get values, 2=get gradients
8.35.2.2 int dotFDSinfo [private]

internal DOT parameter NGOTOZ

the DOT parameter list has been modified to pass NGOTOZ, which signals whether DOT is finite-differencing (nonzero value) or performing the line search (zero value).

8.35.2.3 int dotMethod [private]

METHOD from DOT manual.

For nonlinear constraints: 0/1 = dot_mmfd, 2 = dot_slp, 3 = dot_sqp. For unconstrained: 0/1 = dot_bfgs, 2 = dot_frcg.

8.35.2.4 int printControl [private]

IPRINT from DOT manual (controls output verbosity).

Values range from 0 (least output) to 7 (most output).

8.35.2.5 int optimizationType [private]

MINMAX from DOT manual (minimize or maximize).

Values of 0 or -1 (minimize) or 1 (maximize).

8.35.2.6 RealArray realCntlParmArray [private]

RPRM from DOT manual.

Array of real control parameters.

8.35.2.7 IntArray intCntlParmArray [private]

IPRM from DOT manual.

Array of integer control parameters.

8.35.2.8 RealVector constraintValues [private]

array of nonlinear constraint values passed to DOT

This array must be of nonzero length and must contain only one-sided inequality constraints which are <= 0 (which requires a transformation from 2-sided inequalities and equalities).

8.35.2.9 SizetArray constraintMappingIndices [private]

Response constraints used in computing the DOT constraints.
The length of the container corresponds to the number of DOT constraints, and each entry in the container points to the corresponding DAKOTA constraint.

8.35.2.10 RealArray `constraintMappingMultipliers` [private]

The DOT constraints.

The length of the container corresponds to the number of DOT constraints, and each entry in the container stores a multiplier for the DAKOTA constraint identified with constraintMappingIndices. These multipliers are currently +1 or -1.

8.35.2.11 RealArray `constraintMappingOffsets` [private]

DOT constraints.

The length of the container corresponds to the number of DOT constraints, and each entry in the container stores an offset for the DAKOTA constraint identified with constraintMappingIndices. These offsets involve inequality bounds or equality targets, since DOT assumes constraint allowables = 0.

- `void ofilter_argument_list` ()  
  set argList for execution of the output filter

- `void driver_argument_list` (const int analysis_id)  
  set argList for execution of the specified analysis driver

Private Attributes

- `std::vector<std::string> argList`  
  These are converted to an array of `const char*`'s in `fork_program()`.
8.39.1 Detailed Description

simulations using forks.

ForkAnalysisCode creates a copy of the parent DAKOTA process using fork()/vfork() and then replaces the copy with a simulation process using execvp(). The parent process can then use waitpid() to wait on completion of the simulation process.

8.39.2 Member Function Documentation

8.39.2.1 void check_status (const int status)

error code was returned

Check to see if the process terminated abnormally (WIFEXITED(status)==0) or if either execvp or the application returned a status code of -1 (WIFEXITED(status)!==0 && (signed char)WEXITSTATUS(status)==-1). If one of these conditions is detected, output a failure message and abort. Note: the application code should not return a status code of -1 unless an immediate abort of dakota is wanted. If for instance, failure capturing is to be used, the application code should write the word "FAIL" to the appropriate results file and return a status code of 0 through exit().

  execute analyses asynchronously on the local processor

- void synchronous_local_analyses (const int &start, const int &end, const int &step)
  execute analyses synchronously on the local processor

- void serve_analyses_asynch()
  serve the analysis scheduler and execute analysis jobs asynchronously

Private Attributes

- ForkAnalysisCode forkSimulator
  individual programs and checking fork exit status

- std::map< pid_t, int > processIdMap
  asynchronous evaluations

8.40.1 Detailed Description

using forks.

ForkApplicInterface uses a ForkAnalysisCode object for performing simulation invocations.

8.40.2 Member Function Documentation

8.40.2.1 int derived_synchronous_local_analysis (const int & analysis_id) [inline, virtual]

This code provides the derived function used by ApplicationInterface:: serve_analyses_synch() as well as a convenience function for ForkApplicInterface::synchronous_local_analyses() below.

Reimplemented from ApplicationInterface.

8.40.2.2 pid_t fork_application (const bool block_flag) [private]

filter, analysis programs, and output filter

Manage the input filter, 1 or more analysis programs, and the output filter in blocking or nonblocking mode as governed by block_flag. In the case of a single analysis and no filters, a single fork is performed, while in other cases, an initial fork is reforked multiple times. Called from derived_map() with block_flag == BLOCK and from derived_map_asynch() with block_flag == FALL_THROUGH. Uses ForkAnalysisCode::fork_program() to spawn individual program components within the function evaluation.
void asynchronous_local_analyses (const int & start, const int & end, const int & step) [private]

execute analyses asynchronously on the local processor

Schedule analyses asynchronously on the local processor using a self-scheduling approach (start to end in step increments). Concurrency is limited by asynchLocalAnalysisConcurrency. Modeled after ApplicationInterface::asynchronous_local_evaluations(). NOTE: This function should be elevated to ApplicationInterface if and when another derived interface class supports asynchronous local analyses.

void synchronous_local_analyses (const int & start, const int & end, const int & step) [inline, private]

execute analyses synchronously on the local processor

Execute analyses synchronously in succession on the local processor (start to end in step increments). Modeled after ApplicationInterface::synchronous_local_evaluations().

void serve_analyses_asynch () [private]

serve the analysis scheduler and execute analysis jobs asynchronously

This code runs multiple asynch analyses on each server. It is modeled after ApplicationInterface::serve_evaluations_asynch(). NOTE: This fn should be elevated to ApplicationInterface if and when another derived interface class supports hybrid analysis parallelism.

The documentation for this class was generated from the following files:

const String & sampling_scheme () const
    return sampling name

void vary_pattern (bool pattern_flag)
    sets varyPattern in derived classes that support it

void get_parameter_sets (Model &model)
    Returns one block of samples (ndim * num_samples).

Private Member Functions

void enforce_input_rules ()
    enforce sanity checks/modifications for the user input specification

Private Attributes

int samplesSpec
    initial specification of number of samples

int numSamples
    current number of samples to be evaluated

bool allDataFlag
    Iterator::all_variables() and Iterator::all_responses().

size_t numDACERuns
    counter for number of run() executions for this object

bool latinizeFlag
    flag which specifies latinization of QMC or CVT sample sets

IntVector sequenceStart
    variable sampled. Default is 0 0 0 (e.g. for three random variables).

IntVector sequenceLeap
    generated. Default is 1 1 1 (e.g. for three random vars.)

IntVector primeBase
    generated. Default is 2 3 5 (e.g., for three random vars.)

int seedSpec
    (allows repeatable results)
• int randomSeed
  
  *current seed for the random number generator*

• bool varyPattern
  
  *multiple executions are repeatable but not identical.*

• int numCVTTrials
  
  *specifies the number of sample points taken at internal CVT iteration*

• int trialType
  
  *halton (1), uniform (0), or random (-1). Default is random.*

8.41.1 Detailed Description

Wrapper class for the FSUDace QMC/CVT library.

The FSUDesignCompExp class provides a wrapper for FSUDace, a C++ design of experiments library from Florida State University. This class uses quasi Monte Carlo (QMC) and Centroidal Voronoi Tessellation (CVT) methods to uniformly sample the parameter space spanned by the active bounds of the current Model. It returns all generated samples and their corresponding responses as well as the best sample found.

8.41.2 Constructor & Destructor Documentation

8.41.2.1 FSUDesignCompExp (Model & model)

primary constructor for building a standard DACE iterator

This constructor is called for a standard iterator built with data from probDescDB.

8.41.2.2 FSUDesignCompExp (Model & model, int samples, int seed, const String & sampling_method)

alternate constructor for building a DACE iterator on-the-fly

This alternate constructor is used for instantiations on-the-fly, using only the incoming data. No problem description database queries are used.

8.41.3 Member Function Documentation

8.41.3.1 void pre_run () [virtual]

which can generate all Variables (parameter sets) a priori

pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s pre_run(), if implemented, typically _before_ performing its own implementation steps.

Reimplemented from Iterator.
8.41.3.2 void post_run (std::ostream & s) [virtual]

perform final analysis phase in a standalone way
Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s post_run(), typically _after_ performing its own implementation steps.
Reimplemented from Iterator.

8.41.3.3 int num_samples () const [inline, virtual]

get the current number of samples
Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.
Reimplemented from Iterator.

8.41.3.4 void enforce_input_rules () [private]

enforce sanity checks/modifications for the user input specification
Users may input a variety of quantities, but this function must enforce any restrictions imposed by the sampling algorithms.
The documentation for this class was generated from the following files:

- FSUDesignCompExp.H
- FSUDesignCompExp.C
8.42 GaussProcApproximation Class Reference

Derived approximation class for Gaussian Process implementation.
Inheritance diagram for GaussProcApproximation::

Public Member Functions

- GaussProcApproximation ()
  default constructor

- GaussProcApproximation (size_t num_vars, unsigned short data_order)
  alternate constructor

- GaussProcApproximation (const ProblemDescDB &problem_db, const size_t &num_acv)
  standard constructor

- ~GaussProcApproximation ()
  destructor

 Protected Member Functions

- int min_coefficients () const
  build the derived class approximation type in numVars dimensions

- int num_constraints () const
  return the number of constraints to be enforced via anchorPoint

- void build ()
  find the covariance parameters governing the Gaussian process response

- const Real & get_value (const RealVector &x)
  retrieve the function value for a given parameter set x

- const Real & get_prediction_variance (const RealVector &x)
  retrieve the variance of the predicted value for a given parameter set x

- const RealVector & get_gradient (const RealVector &x)
  for a given parameter set x
Private Member Functions

- void GPmodel_build()
  Function to compute hyperparameters governing the GP.

- void GPmodel_apply(const RealVector &new_x, bool variance_flag, bool gradients_flag)
  Function returns a response value using the GP surface.

- void normalize_training_data()
  Normalizes the initial inputs upon which the GP surface is based.

- void get_trend()
  linear, if order = 2, trend is quadratic.

- void get_beta_coefficients()
  Gets the beta coefficients for the calculation of the mean of the GP.

- int get_cholesky_factor()
  error checking

- void get_process_variance()
  the correlation lengthscales

- void get_cov_matrix()
  calculates the covariance matrix for a given set of input points

- void get_cov_vector()
  set of inputs upon which the GP is based

- void optimize_theta_global()
  parameters using NCSUDirect

- void optimize_theta_multipoint()
  parameters using a gradient-based solver and multiple starting points

- void predict(bool variance_flag, bool gradients_flag)
  Calculates the predicted new response value for x in normalized space.

- Real calc_nll()
  matrix

- void calc_grad_nll()
  to the correlation lengthscales, theta

- void get_grad_cov_vector()
  to each component of x.
• void run_point_selection ()
  estimate the necessary parameters

• void initialize_point_selection ()
  initial subset of the training points

• void pointsel_get_errors (RealArray &delta)
  training points and find the errors

• int addpoint (int, IntArray &added_index)
  Adds a point to the effective training set. Returns 1 on success.

• int pointsel_add_sel (const RealArray &delta)
  them

• Real maxval (const RealArray &) const
  Return the maximum value of the elements in a vector.

• void pointsel_write_points ()
  Writes out the training set before and after point selection.

• void likelihood_2d_grid_eval ()
  likelihood on a grid

• void writex (const char[])
  specified file

• void writeCovMat (char[])
  Writes out the covariance matrix to a specified file.

Static Private Member Functions

• static void negloglik (int mode, int n, const NEWMAT::ColumnVector &X, NEWMAT::Real &fx, NEWMAT::ColumnVector &grad_x, int &result_mode)
  by minimizing the negative log likelihood

• static void constraint_eval (int mode, int n, const NEWMAT::ColumnVector &X, NEWMAT::ColumnVector &g, NEWMAT::Matrix &gradC, int &result_mode)
  this function is empty: it is an unconstrained optimization.

• static double negloglikNCSU (const RealVector &x)
  function used by NCSUOptimizer to optimize negloglik objective
Private Attributes

- RealMatrix `trainPoints`
  
  *used to create the Gaussian process*

- RealMatrix `trainValues`
  
  *An array of response values; one response value per sample site.*

- RealVector `trainMeans`
  
  *The mean of the input columns of trainPoints.*

- RealVector `trainStdvs`
  
  *The standard deviation of the input columns of trainPoints.*

- RealMatrix `normTrainPoints`
  
  *Current working set of normalized points upon which the GP is based.*

- RealMatrix `trendFunction`
  
  *Matrix to hold the trend function*

- RealMatrix `betaCoeffs`
  
  *Matrix to hold the beta coefficients for the trend function*

- RealSymMatrix `covMatrix`
  
  *Between points Xi and Xj in the initial set of samples*

- RealMatrix `covVector`
  
  *Between a new point X and point Xj from the initial set of samples*

- RealMatrix `approxPoint`
  
  *Single point, but it could be generalized to be a vector of points.*

- RealMatrix `gradNegLogLikTheta`
  
  *With respect to the theta correlation terms*

- Teuchos::SerialSpdDenseSolver< int, Real > `covSlvr`
  
  *The covariance matrix*

- RealMatrix `gradCovVector`
  
  *With respect to a particular component of X*

- RealMatrix `normTrainPointsAll`
  
  *Set of all original samples available.*

- RealMatrix `trainValuesAll`
  
  *All original samples available.*
• RealMatrix trendFunctionAll
  Trend function values corresponding to all original samples.

• RealMatrix Rinv_YFb
  Matrix for storing inverse of correlation matrix Rinv\(^*\)(Y-FB).

• size_t numObs
  The number of observations on which the GP surface is built.

• size_t numObsAll
  The original number of observations.

• short trendOrder
  linear, if order = 2, trend is quadratic.

• RealVector thetaParams
  same point. sige is the underlying process error.

• Real procVar
  The process variance, the multiplier of the correlation matrix.

• IntArray pointsAddedIndex
  all points which have been added

• int cholFlag
  A global indicator for success of the Cholesky factorization.

• bool usePointSelection
  a flag to indicate the use of point selection

Static Private Attributes

• static GaussProcApproximation * GPinstance
  pointer to the active object instance used within the static evaluator

8.42.1 Detailed Description

Derived approximation class for Gaussian Process implementation.

The GaussProcApproximation class provides a global approximation (surrogate) based on a Gaussian process. The Gaussian process is built after normalizing the function values, with zero mean. Opt++ is used to determine the optimal values of the covariance parameters, those which minimize the negative log likelihood function.
8.42 GaussProcApproximation Class Reference

8.42.2 Constructor & Destructor Documentation

8.42.2.1 GaussProcApproximation () [inline]

default constructor

alternate constructor used by EffGlobalOptimization and NonDGlobalReliability that does not use a problem
database defaults here are no point selectinn and quadratic trend function.

8.42.3 Member Function Documentation

8.42.3.1 void GPmodel_apply (const RealVector & new_x, bool variance_flag, bool gradients_flag)

[private]

Function returns a response value using the GP surface.
The response value is computed at the design point specified by the RealVector function argument.
The documentation for this class was generated from the following files:

- GaussProcApproximation.H
- GaussProcApproximation.C
8.43 GetLongOpt Class Reference

(Advanced Computer Research Institute, Lyon, France).

Inheritance diagram for GetLongOpt::

```
GetLongOpt
   |       |
   |       CommandLineHandler
```

Public Types

- enum OptType { Valueless, OptionalValue, MandatoryValue }
  enum for different types of values associated with command line options.

Public Member Functions

- **GetLongOpt** (const char optmark= '-')
  Constructor.

- **~GetLongOpt** ()
  Destructor.

- int **parse** (int argc, char *const argv)
  parse the command line args (argc, argv).

- int **parse** (char *const str, char *const p)
  parse a string of options (typically given from the environment).

- int **enroll** (const char *const opt, const OptType t, const char *const desc, const char *const val)
  Add an option to the list of valid command options.

- const char * **retrieve** (const char *const opt) const
  Retrieve value of option.

- void **usage** (std::ostream &outfile=Cout) const
  Print usage information to outfile.

- void **usage** (const char *str)
  Change header of usage output to str.

- void **store** (const char *name, const char *value)
  Store a specified option value.
Private Member Functions

- char * basename (char *const p) const
  extract the base name from a string as delimited by '/'

- int setcell (Cell *c, char *valtoken, char *nexttoken, const char *p)
  internal convenience function for setting Cell::value

Private Attributes

- Cell * table
  option table

- const char * ustring
  usage message

- char * pname
  program basename

- char optmarker
  option marker

- int enroll_done
  finished enrolling

- Cell * last
  last entry in option table

8.43.1 Detailed Description

(Advanced Computer Research Institute, Lyon, France).

GetLongOpt manages the definition and parsing of "long options." Command line options can be abbreviated as long as there is no ambiguity. If an option requires a value, the value should be separated from the option either by whitespace or an "=".

8.43.2 Member Enumeration Documentation

8.43.2.1 enum OptType

enum for different types of values associated with command line options.

Enumerator:

- Valueless  option that may never have a value
OptionalValue option with optional value
MandatoryValue option with required value

8.43.3 Constructor & Destructor Documentation

8.43.3.1 GetLongOpt (const char optmark = ‘-’)

Constructor.
Constructor for GetLongOpt takes an optional argument: the option marker. If unspecified, this defaults to ‘-’, the
standard (?) Unix option marker.

8.43.4 Member Function Documentation

8.43.4.1 int parse (int argc, char ∗const argv)

parse the command line args (argc, argv).
A return value < 1 represents a parse error. Appropriate error messages are printed when errors are seen. parse
returns the the optind (see getopt(3)) if parsing is successful.

8.43.4.2 int parse (char ∗const str, char ∗const p)

parse a string of options (typically given from the environment).
A return value < 1 represents a parse error. Appropriate error messages are printed when errors are seen. parse
takes two strings: the first one is the string to be parsed and the second one is a string to be prefixed to the parse
errors.

8.43.4.3 int enroll (const char ∗const opt, const OptType t, const char ∗const desc, const char ∗const val)

Add an option to the list of valid command options.
enroll adds option specifications to its internal database. The first argument is the option sting. The second is an
enum saying if the option is a flag (Valueless), if it requires a mandatory value (MandatoryValue) or if it takes
an optional value (OptionalValue). The third argument is a string giving a brief description of the option. This
description will be used by GetLongOpt::usage. GetLongOpt, for usage-printing, uses {$val} to represent values
needed by the options. {$val} is a mandatory value and {[val]} is an optional value. The final argument to
enroll is the default string to be returned if the option is not specified. For flags (options with Valueless), use “”
(empty string, or in fact any arbitrary string) for specifying TRUE and 0 (null pointer) to specify FALSE.

8.43.4.4 const char ∗ retrieve (const char ∗const opt) const

Retrieve value of option.
The values of the options that are enrolled in the database can be retrieved using retrieve. This returns a string
and this string should be converted to whatever type you want. See atoi, atof, atol, etc. If a "parse" is not done
before retrieving all you will get are the default values you gave while enrolling! Ambiguities while retrieving
(may happen when options are abbreviated) are resolved by taking the matching option that was enrolled last. For example, -{v} will expand to {-verify}. If you try to retrieve something you didn’t enroll, you will get a warning message.

8.43.4.5  void usage (const char * str)  [inline]

Change header of usage output to str.

GetLongOpt::usage is overloaded. If passed a string "str", it sets the internal usage string to "str". Otherwise it simply prints the command usage.

The documentation for this class was generated from the following files:

- CommandLineHandler.H
- CommandLineHandler.C
8.44 Graphics Class Reference

for post-processing with Matlab, Tecplot, etc.

Public Member Functions

- **Graphics ()**
  
  constructor

  return graphicsCntr

- void tabular_counter_label (const String &label)
  
  set tabularCntrLabel equal to label

Private Attributes

- Graphics2D * graphics2D
  
  pointer to the 2D graphics object

- bool win2dOn
  
  flag to indicate if 2D graphics window is active

- bool tabularDataFlag
  
  flag to indicate if tabular data stream is active

- int graphicsCntr
  
  used for x axis values in 2D graphics and for 1st column in tabular data

- String tabularCntrLabel
  
  label for counter used in first line comment w/ the tabular data file

- std::ofstream tabularDataFStream
  
  file stream for tabulation of graphics data within compute_response

8.44.1 Detailed Description

for post-processing with Matlab, Tecplot, etc.

There is only one Graphics object (dakotaGraphics) and it is global (for convenient access from strategies, models, and approximations).

8.44.2 Member Function Documentation

8.44.2.1 void create_plots_2d (const Variables & vars, const Response & response)

creates the 2d graphics window and initializes the plots

Sets up a single event loop for duration of the dakotaGraphics object, continuously adding data to a single window. There is no reset. To start over with a new data set, you need a new object (delete old and instantiate new).
8.44.2.2 void create_tabular_datastream (const Variables & vars, const Response & response, const String & tabular_data_file)

opens the tabular data file stream and prints the headings
Opens the tabular data file stream and prints headings, one for each continuous and discrete variable and one for each response function, using the variable and response function labels. This tabular data is used for post-processing of DAKOTA results in Matlab, Tecplot, etc.

8.44.2.3 void add_datapoint (const Variables & vars, const Response & response)

the tabular data file based on the results of a model evaluation
Adds data to each 2d plot and each tabular data column (one for each active variable and for each response function). graphicsCntr is used for the x axis in the graphics and the first column in the tabular data.

8.44.2.4 void add_datapoint (int i, double x, double y)

adds data to a single window in the 2d graphics
Adds data to a single 2d plot. Allows complete flexibility in defining other kinds of x-y plotting in the 2D graphics.

8.44.2.5 void new_dataset (int i)

for a single window in the 2d graphics
Used for displaying multiple data sets within the same plot.

8.46.1 Detailed Description

Hierarchical surrogates (models of varying fidelity).

The HierarchSurrModel class manages hierarchical models of varying fidelity. In particular, it uses a low fidelity model as a surrogate for a high fidelity model. The class contains a lowFidelityModel which performs the approximate low fidelity function evaluations and a highFidelityModel which provides truth evaluations for computing corrections to the low fidelity results.

8.46.2 Member Function Documentation

8.46.2.1 void derived_compute_response (const ActiveSet & set) [protected, virtual]

Portion of compute_response() specific to HierarchSurrModel
8.46 HierarchSurrModel Class Reference

Compute the response synchronously using lowFidelityModel, highFidelityModel, or both (mixed case). For the lowFidelityModel portion, compute the high fidelity response if needed with build_approximation(), and, if correction is active, correct the low fidelity results.

Reimplemented from Model.

8.46.2.2 void derived_asynch_compute_response (const ActiveSet & set) [protected, virtual]

portion of asynch_compute_response() specific to HierarchSurrModel

Compute the response asynchronously using lowFidelityModel, highFidelityModel, or both (mixed case). For the lowFidelityModel portion, compute the high fidelity response with build_approximation() (for correcting the low fidelity results in derived_synchronize() and derived_synchronize_nowait()) if not performed previously.

Reimplemented from Model.

8.46.2.3 const IntResponseMap & derived_synchronize () [protected, virtual]

portion of synchronize() specific to HierarchSurrModel

Blocking retrieval of asynchronous evaluations from lowFidelityModel, highFidelityModel, or both (mixed case). For the lowFidelityModel portion, apply correction (if active) to each response in the array. derived_synchronize() is designed for the general case where derived_asynch_compute_response() may be inconsistent in its use of low fidelity evaluations, high fidelity evaluations, or both.

Reimplemented from Model.

8.46.2.4 const IntResponseMap & derived_synchronize_nowait () [protected, virtual]

portion of synchronize_nowait() specific to HierarchSurrModel

Nonblocking retrieval of asynchronous evaluations from lowFidelityModel, highFidelityModel, or both (mixed case). For the lowFidelityModel portion, apply correction (if active) to each response in the map. derived_synchronize_nowait() is designed for the general case where derived_asynch_compute_response() may be inconsistent in its use of actual evals, approx evals, or both.

Reimplemented from Model.

8.46.2.5 int evaluation_id () const [inline, protected, virtual]

Return the current evaluation id for the HierarchSurrModel.

return the hierarchical model evaluation count. Due to possibly intermittent use of surrogate bypass, this is not the same as either the loFi or hiFi model evaluation counts. It also does not distinguish duplicate evals.

Reimplemented from Model.

The documentation for this class was generated from the following files:

- HierarchSurrModel.H
- HierarchSurrModel.C
**8.47 HybridStrategy Class Reference**

  within an ApproximationInterface

- virtual const SDPLList & `approximation_data` (size_t index)
within an `ApproximationInterface`

- **virtual const StringArray & analysis_drivers() const**
  
  retrieve the analysis drivers specification for application interfaces

- **virtual const AnalysisCode * analysis_code() const**
  
  return `AnalysisCode::fileNameMap` when defined for derived `Interface` class

- **void assign_rep (Interface *interface_rep, bool ref_count_incr=true)**
  
  replaces existing letter with a new one

- **const String & interface_type() const**
  
  returns the interface type

- **const String & interface_id() const**
  
  returns the interface identifier

- **int evaluation_id() const**
  
  returns the current function evaluation id for the interface

- **void fine_grained_evaluation_counters (size_t num_fns)**
  
  set fineGrainEvalCounters to true and initialize counters if needed

- **void init_evaluation_counters (size_t num_fns)**
  
  initialize fine-grained evaluation counters

- **void set_evaluation_reference()**
  
  set evaluation count reference points for the interface

- **void print_evaluation_summary (std::ostream &s, bool minimal_header, bool relative_count) const**
  
  print an evaluation summary for the interface

- **bool multi_proc_eval_flag() const**
  
  returns a flag signaling the use of multiprocessor evaluation partitions

- **bool iterator_eval_dedicated_master_flag() const**
  
  iterator-evaluation scheduling level

- **bool is_null() const**
  
  function to check interfaceRep (does this envelope contain a letter?)
Protected Member Functions

- **Interface** (BaseConstructor, const ProblemDescDB &problem_db)
  derived class constructors - Coplien, p. 159

- **Interface** (NoDBBaseConstructor, size_t num_fns)
  (NoDBBaseConstructor used for on the fly instantiations without a DB)

### 8.48.1 Detailed Description

Base class for the interface class hierarchy.

The **Interface** class hierarchy provides the part of a **Model** that is responsible for mapping a set of **Variables** into a set of **Responses**. The mapping is performed using either a simulation-based application interface or a surrogate-based approximation interface. For memory efficiency and enhanced polymorphism, the interface hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (**Interface**) serves as the envelope and one of the derived classes (selected in **Interface::get_interface()**) serves as the letter.

### 8.48.2 Constructor & Destructor Documentation

#### 8.48.2.1 **Interface ()**

default constructor

used in **Model** envelope class instantiations

#### 8.48.2.2 **Interface (ProblemDescDB & problem_db)**

standard constructor for envelope

Used in **Model** instantiation to build the envelope. This constructor only needs to extract enough data to properly execute get_interface, since **Interface::Interface(BaseConstructor, problem_db)** builds the actual base class data inherited by the derived interfaces.

#### 8.48.2.3 **Interface (const Interface & interface)**

copy constructor

Copy constructor manages sharing of interfaceRep and incrementing of referenceCount.
8.48.2.4  ~Interface ()  [virtual]

destructor

Destructor decrements referenceCount and only deletes interfaceRep if referenceCount is zero.

8.48.2.5  Interface (BaseConstructor, const ProblemDescDB & problem_db)  [protected]

derived class constructors - Coplien, p. 139)

This constructor is the one which must build the base class data for all inherited interfaces. get_interface() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_interface() again). Since this is the letter and the letter IS the representation, interfaceRep is set to NULL (an uninitialized pointer causes problems in ~Interface).

8.48.3  Member Function Documentation

8.48.3.1  Interface operator= (const Interface & interface)

assignment operator

8.48.3.2  void assign_rep (Interface ∗ interface_rep, bool ref_count_incr = true)

replaces existing letter with a new one

Similar to the assignment operator, the assign_rep() function decrements referenceCount for the old interfaceRep and assigns the new interfaceRep. It is different in that it is used for publishing derived class letters to existing envelopes, as opposed to sharing representations among multiple envelopes (in particular, assign_rep is passed a letter object and operator= is passed an envelope object). Letter assignment supports two models as governed by ref_count_incr:

- ref_count_incr = true (default): the incoming letter belongs to another envelope. In this case, increment the reference count in the normal manner so that deallocation of the letter is handled properly.

- ref_count_incr = false: the incoming letter is instantiated on the fly and has no envelope. This case is modeled after get_interface(): a letter is dynamically allocated using new and passed into assign_rep, the letter’s reference count is not incremented, and the letter is not remotely deleted (its memory management is passed over to the envelope).

8.48.3.3  Interface ∗ get_interface (ProblemDescDB & problem_db)  [private]

Used by the envelope to instantiate the correct letter class.

used only by the envelope constructor to initialize interfaceRep to the appropriate derived type.
8.48 Interface Class Reference

8.48.4 Member Data Documentation

8.48.4.1 IntResponseMap rawResponseMap [protected]

of asynchronous evaluations.

The map is a full/partial set of completions which are identified through their fnEvalId key. The raw set is postprocessed (i.e., finite difference gradients merged) in Model::synchronize() where it becomes responseMap.

The documentation for this class was generated from the following files:

- DakotaInterface.H
- DakotaInterface.C

• ShortArray secondaryADIVarMapTargets
  from higher level iteration

• ShortArray secondaryADRVarMapTargets
  from higher level iteration

• String gradientType
  type of gradient data: analytic, numerical, mixed, or none

• String methodSource
  source of numerical gradient routine: dakota or vendor

• String intervalType
  type of numerical gradient interval: central or forward

• String hessianType
  type of Hessian data: analytic, numerical, quasi, mixed, or none

• Real fdGradStepSize
  relative finite difference step size for numerical gradients

• Real fdHessByGradStepSize
  using first-order differences of gradients

• Real fdHessByFnStepSize
  using second-order differences of function values

• short outputLevel
  output verbosity level: [SILENT, QUIET, NORMAL, VERBOSE, DEBUG]_OUTPUT
• bool summaryOutputFlag
  sub-iterator use cases

• bool asynchFlag
  copy of the model’s asynchronous evaluation flag

• int writePrecision
  write precision as specified by the user

Private Member Functions

• Iterator * get_iterator (Model &model)
  Used by the envelope to instantiate the correct letter class.

• Iterator * get_iterator (const String &method_name, Model &model)
  Used by the envelope to instantiate the correct letter class.

• virtual void pre_output ()
  convenience function to write variables to file, following pre-run

• virtual void post_input ()
  read tabular data for post-run mode

Private Attributes

• String idMethod
  method identifier string from the input file

• Iterator * iteratorRep
  pointer to the letter (initialized only for the envelope)

• int referenceCount
  number of objects sharing iteratorRep

8.49.1 Detailed Description

Base class for the iterator class hierarchy.

The Iterator class is the base class for one of the primary class hierarchies in DAKOTA. The iterator hierarchy contains all of the iterative algorithms which use repeated execution of simulations as function evaluations. For memory efficiency and enhanced polymorphism, the iterator hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (Iterator) serves as the envelope and one of the derived classes (selected in Iterator::get_iterator()) serves as the letter.
8.49.2 Constructor & Destructor Documentation

8.49.2.1 Iterator ()

default constructor

The default constructor is used in Vector<Iterator> instantiations and for initialization of Iterator objects contained in Strategy derived classes (see derived class header files). iteratorRep is NULL in this case (a populated problem_db is needed to build a meaningful Iterator object). This makes it necessary to check for NULL pointers in the copy constructor, assignment operator, and destructor.

8.49.2.2 Iterator (Model & model)

standard envelope constructor

Used in iterator instantiations within strategy constructors. Envelope constructor only needs to extract enough data to properly execute get_iterator(), since letter holds the actual base class data.

8.49.2.3 Iterator (const String & method_name, Model & model)

alternate envelope constructor for instantiations by name

Used in sub-iterator instantiations within iterator constructors. Envelope constructor only needs to extract enough data to properly execute get_iterator(), since letter holds the actual base class data.

8.49.2.4 Iterator (const Iterator & iterator)

copy constructor

Copy constructor manages sharing of iteratorRep and incrementing of referenceCount.

8.49.2.5 ~Iterator () [virtual]

destructor

Destructor decrements referenceCount and only deletes iteratorRep when referenceCount reaches zero.

8.49.2.6 Iterator (BaseConstructor, Model & model) [protected]

derived class constructors - Coplien, p. 139)

This constructor builds the base class data for all inherited iterators. get_iterator() instantiates a derived class and the derived class selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_iterator() again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Iterator).

8.49.2.7 Iterator (NoDBBaseConstructor, Model & model) [protected]

alternate constructor for base iterator classes constructed on the fly
This alternate constructor builds base class data for inherited iterators. It is used for on-the-fly instantiations for which DB queries cannot be used. Therefore it only sets attributes taken from the incoming model. Since there are no iterator-specific redefinitions of maxIterations or numFinalSolutions in NoDBBaseConstructor mode, go ahead and assign default value for all iterators.

8.49.2.8 Iterator (NoDBBaseConstructor) [protected]

alternate constructor for base iterator classes constructed on the fly

This alternate constructor builds base class data for inherited iterators. It is used for on-the-fly instantiations for which DB queries cannot be used. It has no incoming model, so only sets up a minimal set of defaults. However, its use is preferable to the default constructor, which should remain as minimal as possible. Since there are no iterator-specific redefinitions of maxIterations or numFinalSolutions in NoDBBaseConstructor mode, go ahead and assign default value for all iterators.

8.49.3 Member Function Documentation

8.49.3.1 Iterator operator= (const Iterator & iterator)

assignment operator

8.49.3.2 void initialize_run () [virtual]

typically memory initialization; setting of instance pointers

Perform initialization phases of run sequence, like allocating memory and setting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s initialize_run(), typically _before_ performing its own implementation steps.

Reimplemented in CONMINOptimizer, LeastSq, Minimizer, NonD, Optimizer, DOTOptimizer, NLPQLPOptimizer, SNLLLeastSq, and SNLLOptimizer.

8.49.3.3 void pre_run () [virtual]

which can generate all Variables (parameter sets) a priori

pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s pre_run(), if implemented, typically _before_ performing its own implementation steps.

Reimplemented in DDACEDesignCompExp, FSUDesignCompExp, NonDLHSSampling, ParamStudy, and PSUADEDesignCompExp.

8.49.3.4 void run () [virtual]

and may include pre/post steps in lieu of separate pre/post
Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.
Reimplemented in LeastSq, NonD, Optimizer, PStudyDACE, Verification, and SurrBasedMinimizer.

**8.49.3.5 void post_run (std::ostream & s) [virtual]**

perform final analysis phase in a standalone way
Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent's `post_run()`, typically _after_ performing its own implementation steps.
Reimplemented in COLINOptimizer, LeastSq, Optimizer, DDACEDesignCompExp, FSUDesignCompExp, NonDLHSSampling, ParamStudy, PSUADEDesignCompExp, SNLLLeastSq, and SNLLOptimizer.

**8.49.3.6 void finalize_run () [virtual]**
deallocation and resetting of instance pointers
Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent's `finalize_run()`, typically _after_ performing its own implementation steps.
Reimplemented in LeastSq, Minimizer, NonD, Optimizer, SNLLLeastSq, and SNLLOptimizer.

**8.49.3.7 void initialize_graphics (bool graph_2d, bool tabular_data, const String & tabular_file) [virtual]**
initialize the 2D graphics window and the tabular graphics data
This is a convenience function for encapsulating graphics initialization operations. It does not require a strategy-Rep forward since it is only used by letter objects.
Reimplemented in NonDReliability, and SurrBasedMinimizer.

**8.49.3.8 void print_results (std::ostream & s) [virtual]**
print the final iterator results
This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in `finalize_run()`.
Reimplemented in Analyzer, LeastSq, Optimizer, PStudyDACE, Verification, NonDExpansion, NonDGlobalReliability, NonDGPMsABayesCalibration, NonDIncrmLHSSampling, NonDInterval, NonDLHSSampling, NonDLocalReliability, RichExtrapVerification, and SurrBasedMinimizer.

**8.49.3.9 int num_samples () const [virtual]**
get the current number of samples
Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.

Reimplemented in DDACEDesignCompExp, FSUDesignCompExp, NonDSampling, and PSUADEDesignCompExp.

8.49.3.10  void run_iterator (std::ostream & s)

orchestrate initialize/pre/run/post/finalize phases

Iterator supports a construct/initialize-run/pre-run/run/post-run/finalize-run/destruct progression. This member (non-virtual) function sequences these run phases; it accepts an ostream, but controls verbosity with outputLevel

8.49.3.11  void assign_rep (Iterator * iterator_rep, bool ref_count_incr = true)

replaces existing letter with a new one

Similar to the assignment operator, the assign_rep() function decrements referenceCount for the old iteratorRep and assigns the new iteratorRep. It is different in that it is used for publishing derived class letters to existing envelopes, as opposed to sharing representations among multiple envelopes (in particular, assign_rep is passed a letter object and operator= is passed an envelope object). Letter assignment supports two models as governed by ref_count_incr:

- ref_count_incr = true (default): the incoming letter belongs to another envelope. In this case, increment the reference count in the normal manner so that deallocation of the letter is handled properly.

- ref_count_incr = false: the incoming letter is instantiated on the fly and has no envelope. This case is modeled after get_iterator(): a letter is dynamically allocated using new and passed into assign_rep, the letter’s reference count is not incremented, and the letter is not remotely deleted (its memory management is passed over to the envelope).

8.49.3.12  Iterator * get_iterator (Model & model) [private]

Used by the envelope to instantiate the correct letter class.

Used only by the envelope constructor to initialize iteratorRep to the appropriate derived type, as given by the methodName attribute.

8.49.3.13  Iterator * get_iterator (const String & method_name, Model & model) [private]

Used by the envelope to instantiate the correct letter class.

Used only by the envelope constructor to initialize iteratorRep to the appropriate derived type, as given by the passed method_name.
8.49.4 Member Data Documentation

8.49.4.1 Real fdGradStepSize [protected]

relative finite difference step size for numerical gradients
A scalar value (instead of the vector fd_gradient_step_size spec) is used within the iterator hierarchy since this attribute is only used to publish a step size to vendor numerical gradient algorithms.

8.49.4.2 Real fdHessByGradStepSize [protected]

using first-order differences of gradients
A scalar value (instead of the vector fd_hessian_step_size spec) is used within the iterator hierarchy since this attribute is only used to publish a step size to vendor numerical Hessian algorithms.

8.49.4.3 Real fdHessByFnStepSize [protected]

using second-order differences of function values
A scalar value (instead of the vector fd_hessian_step_size spec) is used within the iterator hierarchy since this attribute is only used to publish a step size to vendor numerical Hessian algorithms.

The documentation for this class was generated from the following files:

- DakotaIterator.H
- DakotaIterator.C
8.50 JEGAOptimizer Class Reference

A version of Dakota::Optimizer for instantiation of John Eddy’s Genetic Algorithms (JEGA).

Inheritance diagram for JEGAOptimizer:

```
  Iterator
  Minimizer
  Optimizer
  JEGAOptimizer
```

Public Member Functions

- virtual void find_optimum ()
  
  Performs the iterations to determine the optimal set of solutions.

- virtual bool accepts_multiple_points () const
  
  Overridden to return true since JEGA algorithms can accept multiple initial points.

- virtual bool returns_multiple_points () const
  
  Overridden to return true since JEGA algorithms can return multiple final points.

- virtual void initial_points (const VariablesArray &pts)
  
  Overridden to assign the _initPts member variable to the passed in collection of Dakota::Variables.

- virtual const VariablesArray & initial_points () const
  
  Overridden to return the collection of initial points for the JEGA algorithm created and run by this JEGAOptimizer.

- JEGAOptimizer (Model &model)
  
  Constructs a JEGAOptimizer class object.

- ~JEGAOptimizer ()
  
  Destructs a JEGAOptimizer.

Protected Member Functions

- void LoadDakotaResponses (const JEGA::Utilities::Design &from, Variables &vars, Response &resp) const
  
  Loads the JEGA-style Design class into equivalent Dakota-style Variables and Response objects.
void ReCreateTheParameterDatabase()
  Destroys the current parameter database and creates a new empty one.

void LoadTheParameterDatabase()
  Reads information out of the known Dakota::ProblemDescDB and puts it into the current parameter database.

void LoadAlgorithmConfig(JEGA::FrontEnd::AlgorithmConfig &aConfig)
  Completely initializes the supplied algorithm configuration.

void LoadProblemConfig(JEGA::FrontEnd::ProblemConfig &pConfig)
  Completely initializes the supplied problem configuration.

void LoadTheDesignVariables(JEGA::FrontEnd::ProblemConfig &pConfig)
  Adds DesignVariableInfo objects into the problem configuration object.

void LoadTheObjectiveFunctions(JEGA::FrontEnd::ProblemConfig &pConfig)
  Adds ObjectiveFunctionInfo objects into the problem configuration object.

void LoadTheConstraints(JEGA::FrontEnd::ProblemConfig &pConfig)
  Adds ConstraintInfo objects into the problem configuration object.

void GetBestSolutions(const JEGA::Utilities::DesignOFSortSet &from, std::multimap<RealRealPair, JEGA::Utilities::Design*> &designSortMap)
  Returns up to _numBest designs sorted by DAKOTA’s fitness (L2 constraint violation, then utopia or objective),
  taking into account the algorithm type. The front of the returned map can be viewed as a single "best".

void GetBestMOSolutions(const JEGA::Utilities::DesignOFSortSet &from, std::multimap<RealRealPair, JEGA::Utilities::Design*> &designSortMap)
  Retreive the best Designs from a set of solutions assuming that they are generated by a multi objective algorithm.

void GetBestSOSolutions(const JEGA::Utilities::DesignOFSortSet &from, std::multimap<RealRealPair, JEGA::Utilities::Design*> &designSortMap)
  Retreive the best Designs from a set of solutions assuming that they are generated by a single objective algorithm.

void resize_variables_results_array(std::size_t newsize)
  Safely resizes the best variables array taking into account the requirements put forth by the envelope-letter design pattern.

void resize_response_results_array(std::size_t newsize)
  Safely resizes the best response array taking into account the requirements put forth by the envelope-letter design pattern.
Private Attributes

- `EvaluatorCreator * _theEvalCreator`
  A pointer to an `EvaluatorCreator` used to create the evaluator used by JEGA in Dakota (a JEGAEvaluator).

- `JEGA::Utilities::ParameterDatabase * _theParamDB`
  A pointer to the ParameterDatabase from which all parameters are retrieved by the created algorithms.

- `VariablesArray _initPts`
  An array of initial points to use as an initial population.

Static Private Attributes

- `static const std::string SOGA_METHOD_TXT`
  The text that indicates the SOGA method.

- `static const std::string MOGA_METHOD_TXT`
  The text that indicates the MOGA method.

Classes

- `class Driver`
  A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm.

- `class Evaluator`
  An evaluator specialization that knows how to interact with Dakota.

- `class EvaluatorCreator`
  A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a `Evaluator`.

8.50.1 Detailed Description

A version of Dakota::Optimizer for instantiation of John Eddy’s Genetic Algorithms (JEGA).

This class encapsulates the necessary functionality for creating and properly initializing the JEGA algorithms (MOGA and SOGA).

8.50.2 Constructor & Destructor Documentation

8.50.2.1 `JEGAOptimizer (Model & model)`

Constructs a JEGAOptimizer class object.

This method does some of the initialization work for the algorithm. In particular, it initialized the JEGA core.
Parameters:

\textit{model} \hspace{1em} The Dakota::Model that will be used by this optimizer for problem information, etc.

8.50.3 Member Function Documentation

8.50.3.1 \texttt{void LoadDakotaResponses} \hspace{1em} \texttt{(const JEGA::Utilities::Design &\hspace{1em} from, Variables &\hspace{1em} vars, Response &\hspace{1em} resp) const} \hspace{1em} [protected]

Loads the JEGA-style Design class into equivalent Dakota-style Variables and Response objects.
This version is meant for the case where a Variables and a Response object exist and just need to be loaded.

Parameters:

\textit{from} \hspace{1em} The JEGA Design class object from which to extract the variable and response information for Dakota.
\textit{vars} \hspace{1em} The Dakota::Variables object into which to load the design variable values of \textit{from}.
\textit{resp} \hspace{1em} The Dakota::Response object into which to load the objective function and constraint values of \textit{from}.

8.50.3.2 \texttt{void LoadTheParameterDatabase} () \hspace{1em} [protected]

Reads information out of the known Dakota::ProblemDescDB and puts it into the current parameter database.
This should be called from the JEGAOptimizer constructor since it is the only time when the problem description database is certain to be configured to supply data for this optimizer.

8.50.3.3 \texttt{void LoadAlgorithmConfig} \hspace{1em} \texttt{(JEGA::FrontEnd::AlgorithmConfig &aConfig)} \hspace{1em} [protected]

Completely initializes the supplied algorithm configuration.
This loads the supplied configuration object with appropriate data retrieved from the parameter database.

Parameters:

\textit{aConfig} \hspace{1em} The algorithm configuration object to load.

8.50.3.4 \texttt{void LoadProblemConfig} \hspace{1em} \texttt{(JEGA::FrontEnd::ProblemConfig &pConfig)} \hspace{1em} [protected]

Completely initializes the supplied problem configuration.
This loads the fresh configuration object using the LoadTheDesignVariables, LoadTheObjectiveFunctions, and LoadTheConstraints methods.

Parameters:

\textit{pConfig} \hspace{1em} The problem configuration object to load.
8.50.3.5  void LoadTheDesignVariables (JEGA::FrontEnd::ProblemConfig & pConfig)  [protected]

Adds DesignVariableInfo objects into the problem configuration object.
This retrieves design variable information from the ParameterDatabase and creates DesignVariableInfo’s from it.

Parameters:

  pConfig  The problem configuration object to load.

8.50.3.6  void LoadTheObjectiveFunctions (JEGA::FrontEnd::ProblemConfig & pConfig)
           [protected]

Adds ObjectiveFunctionInfo objects into the problem configuration object.
This retrieves objective function information from the ParameterDatabase and creates ObjectiveFunctionInfo’s from it.

Parameters:

  pConfig  The problem configuration object to load.

8.50.3.7  void LoadTheConstraints (JEGA::FrontEnd::ProblemConfig & pConfig)  [protected]

Adds ConstraintInfo objects into the problem configuration object.
This retrieves constraint function information from the ParameterDatabase and creates ConstraintInfo’s from it.

Parameters:

  pConfig  The problem configuration object to load.

8.50.3.8  void GetBestSolutions (const JEGA::Utilities::DesignOFSortSet & from,
                           std::multimap<RealRealPair, JEGA::Utilities::Design * > & designSortMap)  [protected]

Returns up to _numBest designs sorted by DAKOTA’s fitness (L2 constraint violation, then utopia or objective),
taking into account the algorithm type. The front of the returned map can be viewed as a single "best".

Parameters:

  from   The full set of designs returned by the solver.
  designSortMap   Map of best solutions with key pair<constraintViolation, fitness>

Eventually this functionality must be moved into a separate post-processing application for MO datasets.

8.50.3.9  void GetBestMOSolutions (const JEGA::Utilities::DesignOFSortSet & from,
                               std::multimap<RealRealPair, JEGA::Utilities::Design * > & designSortMap)  [protected]

Retreive the best Designs from a set of solutions assuming that they are generated by a multi objective algorithm.
Eventually this functionality must be moved into a separate post-processing application for MO datasets.
8.50.3.10 void GetBestSOSolutions (const JEGA::Utilities::DesignOFSortSet & from, std::multimap<RealRealPair, JEGA::Utilities::Design *> & designSortMap) [protected]
Retrieves the best Designs from a set of solutions assuming that they are generated by a single objective algorithm. Eventually, this functionality must be moved into a separate post-processing application for MO datasets.

8.50.3.11 JEGA::DoubleMatrix ToDoubleMatrix (const VariablesArray & variables) const [protected]
Converts the items in a VariablesArray into a DoubleMatrix whereby the items in the matrix are the design variables. The matrix will not contain responses but when being used by Dakota, this doesn’t matter. JEGA will attempt to re-evaluate these points but Dakota will recognize that they do not require re-evaluation and thus it will be a cheap operation.

**Parameters:**
- **variables** The array of DakotaVariables objects to use as the contents of the returned matrix.

**Returns:**
- The matrix created using the supplied VariablesArray.

8.50.3.12 void resize_variables_results_array (std::size_t newsize) [protected]
Safely resizes the best variables array taking into account the requirements put forth by the envelope-letter design pattern. Do not directly call resize on the bestVariablesArray object unless you intend to share the internal content (letter) with other objects after assignment.

**Parameters:**
- **newsize** The new size for the variables array.

8.50.3.13 void resize_response_results_array (std::size_t newsize) [protected]
Safely resizes the best response array taking into account the requirements put forth by the envelope-letter design pattern. Do not directly call resize on the bestResponseArray object unless you intend to share the internal content (letter) with other objects after assignment.

**Parameters:**
- **newsize** The new size for the responses array.
8.50.3.14  void find_optimum () [virtual]

Performs the iterations to determine the optimal set of solutions.
Override of pure virtual method in Optimizer base class.
The extraction of parameter values actually occurs in this method when the JEGA::FrontEnd::Driver::ExecuteAlgorithm is called. Also the loading of the problem and algorithm configurations occurs in this method. That way, if it is called more than once and the algorithm or problem has changed, it will be accounted for.
Implements Optimizer.

8.50.3.15  bool accepts_multiple_points () const [virtual]

Overridden to return true since JEGA algorithms can accept multiple initial points.

Returns:
    true, always.
Reimplemented from Iterator.

8.50.3.16  bool returns_multiple_points () const [virtual]

Overridden to return true since JEGA algorithms can return multiple final points.

Returns:
    true, always.
Reimplemented from Iterator.

8.50.3.17  void initial_points (const VariablesArray & pts) [virtual]

Overridden to assign the _initPts member variable to the passed in collection of Dakota::Variables.

Parameters:
    pts  The array of initial points for the JEGA algorithm created and run by this JEGAOptimizer.
Reimplemented from Iterator.

8.50.3.18  const VariablesArray & initial_points () const [virtual]

Overridden to return the collection of initial points for the JEGA algorithm created and run by this JEGAOptimizer.

Returns:
    The collection of initial points for the JEGA algorithm created and run by this JEGAOptimizer.
Reimplemented from Iterator.
8.50.4  Member Data Documentation

8.50.4.1  VariablesArray _initPts  [private]

An array of initial points to use as an initial population.
This member is here to help support the use of JEGA algorithms in Dakota strategies. If this array is populated,
then whatever initializer is specified will be ignored and the DoubleMatrix initializer will be used instead on a
matrix created from the data in this array.
The documentation for this class was generated from the following files:

- JEGAOptimizer.H
- JEGAOptimizer.C
8.51 JEGAOptimizer::Driver Class Reference

A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm.

Public Member Functions

- GeneticAlgorithm * ExtractAllData (const AlgorithmConfig &algConfig)
  
  Reads all required data from the problem description database stored in the supplied algorithm config.

- DesignOFSortSet PerformIterations (GeneticAlgorithm *theGA)
  
  Performs the required iterations on the supplied GA.

- void DestroyAlgorithm (GeneticAlgorithm *theGA)
  
  Deletes the supplied GA.

- Driver (const ProblemConfig &probConfig)
  
  Default constructs a Driver.

8.51.1 Detailed Description

A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm. This is necessary because DAKOTA requires that all problem information be extracted from the problem description DB at the time of Optimizer construction and the front end does it all in the execute algorithm method which must be called in find_optimum.

8.51.2 Constructor & Destructor Documentation

8.51.2.1 Driver (const ProblemConfig & probConfig) [inline]

Default constructs a Driver.

Parameters:

  probConfig  The definition of the problem to be solved by this Driver whenever ExecuteAlgorithm is called.

The problem can be solved in multiple ways by multiple algorithms even using multiple different evaluators by issuing multiple calls to ExecuteAlgorithm with different AlgorithmConfigs.

8.51.3 Member Function Documentation

8.51.3.1 GeneticAlgorithm* ExtractAllData (const AlgorithmConfig & algConfig) [inline]

Reads all required data from the problem description database stored in the supplied algorithm config.
The returned GA is fully configured and ready to be run. It must also be destroyed at some later time. You MUST call DestroyAlgorithm for this purpose. Failure to do so could result in a memory leak and an eventual segmentation fault! Be sure to call DestroyAlgorithm prior to destroying the algorithm config that was used to create it!

This is just here to expose the base class method to users.

**Parameters:**

*algConfig* The fully loaded configuration object containing the database of parameters for the algorithm to be run on the known problem.

**Returns:**

The fully configured and loaded GA ready to be run using the PerformIterations method.

### 8.51.3.2 DesignOFSortSet PerformIterations (GeneticAlgorithm *theGA)  [inline]

Perform the required iterations on the supplied GA.

This includes the calls to AlgorithmInitialize and AlgorithmFinalize and logs some information if appropriate.

This is just here to expose the base class method to users.

**Parameters:**

*theGA* The GA on which to perform iterations. This parameter must be non-null.

**Returns:**

The final solutions reported by the supplied GA after all iterations and call to AlgorithmFinalize.

### 8.51.3.3 void DestroyAlgorithm (GeneticAlgorithm *theGA)  [inline]

Deletes the supplied GA.

Use this method to destroy a GA after all iterations have been run. This method knows if the log associated with the GA was created here and needs to be destroyed as well or not.

This is just here to expose the base class method to users.

Be sure to use this prior to destroying the algorithm config object which contains the target. The GA destructor needs the target to be in tact.

**Parameters:**

*theGA* The algorithm that is no longer needed and thus must be destroyed.

The documentation for this class was generated from the following file:

- JEGAOptimizer.C
8.52 JEGAOptimizer::Evaluator Class Reference

An evaluator specialization that knows how to interact with Dakota.

Public Member Functions

- virtual bool Evaluate (DesignGroup &group)
  
  Does evaluation of each design in group.

- virtual bool Evaluate (Design &des)
  
  This method cannot be used!!

- virtual std::string GetName () const
  
  Returns the proper name of this operator.

- virtual std::string GetDescription () const
  
  Returns a full description of what this operator does and how.

- virtual GeneticAlgorithmOperator * Clone (GeneticAlgorithm &algorithm) const
  
  Creates and returns a pointer to an exact duplicate of this operator.

- Evaluator (GeneticAlgorithm &algorithm, Model &model)
  
  Constructs a Evaluator for use by algorithm.

- Evaluator (const Evaluator &copy)
  
  Copy constructs a Evaluator.

- Evaluator (const Evaluator &copy, GeneticAlgorithm &algorithm, Model &model)
  
  Copy constructs a Evaluator for use by algorithm.

Static Public Member Functions

- static const std::string & Name ()
  
  Returns the proper name of this operator.

- static const std::string & Description ()
  
  Returns a full description of what this operator does and how.

Protected Member Functions

- void SeparateVariables (const Design &from, RealVector &intoCont, IntVector &intoDiscInt, RealVector &intoDiscReal) const
  
  This method fills intoCont, intoDiscInt and intoDiscReal appropriately using the values of from.
void RecordResponses (const RealVector &from, Design &into) const

Records the computed objective and constraint function values into into.

std::size_t GetNumberNonLinearConstraints () const

Returns the number of non-linear constraints for the problem.

std::size_t GetNumberLinearConstraints () const

Returns the number of linear constraints for the problem.

Private Member Functions

- **Evaluator** (GeneticAlgorithm &algorithm)
  
  This constructor has no implementation and cannot be used.

Private Attributes

- **Model & _model**
  
  The Model known by this evaluator.

8.52.1 Detailed Description

An evaluator specialization that knows how to interact with Dakota. This evaluator knows how to use the model to do evaluations both in synchronous and asynchronous modes.

8.52.2 Constructor & Destructor Documentation

8.52.2.1 **Evaluator** (GeneticAlgorithm & algorithm, Model & model) [inline]

Constructs a Evaluator for use by algorithm.

The optimizer is needed for purposes of variable scaling.

Parameters:

- **algorithm** The GA for which the new evaluator is to be used.
- **model** The model through which evaluations will be done.
8.52.2.2 Evaluator (const Evaluator & copy) [inline]

Copy constructs a Evaluator.

Parameters:

copy The evaluator from which properties are to be duplicated into this.

8.52.2.3 Evaluator (const Evaluator & copy, GeneticAlgorithm & algorithm, Model & model) [inline]

Copy constructs a Evaluator for use by algorithm.
The optimizer is needed for purposes of variable scaling.

Parameters:

copy The existing Evaluator from which to retrieve properties.
algorithm The GA for which the new evaluator is to be used.
model The model through which evaluations will be done.

8.52.2.4 Evaluator (GeneticAlgorithm & algorithm) [private]

This constructor has no implementation and cannot be used.
The constructor can never be used. It is provided so that this operator can still be registered in an operator registry even though it can never be instantiated from there.

Parameters:

algorithm The GA for which the new evaluator is to be used.

8.52.3 Member Function Documentation

8.52.3.1 static const std::string& Name () [inline, static]

Returns the proper name of this operator.

Returns:

The string "DAKOTA JEGA Evaluator".

8.52.3.2 static const std::string& Description () [inline, static]

Returns a full description of what this operator does and how.
The returned text is:
This evaluator uses Sandia’s DAKOTA optimization software to evaluate the passed in Designs. This makes it possible to take advantage of the fact that DAKOTA is designed to run on massively parallel machines.

Returns:

A description of the operation of this operator.

8.52.3.3  void SeparateVariables (const Design & from, RealVector & intoCont, IntVector & intoDiscInt, RealVector & intoDiscReal) const  [protected]

This method fills intoCont, intoDiscInt and intoDiscReal appropriately using the values of from. The discrete integer design variable values are placed in intoDiscInt, the discrete real design variable values are placed in intoDiscReal, and the continuum are placed into intoCont. The values are written into the vectors from the beginning so any previous contents of the vectors will be overwritten.

Parameters:

from  The Design class object from which to extract the discrete design variable values.
intoDiscInt  The vector into which to place the extracted discrete integer values.
intoDiscReal  The vector into which to place the extracted discrete real values.
intoCont  The vector into which to place the extracted continuous values.

8.52.3.4  void RecordResponses (const RealVector & from, Design & into) const  [protected]

Records the computed objective and constraint function values into into. This method takes the response values stored in from and properly transfers them into the into design. The response vector from is expected to contain values for each objective function followed by values for each non-linear constraint in the order in which the info objects were loaded into the target by the optimizer class.

Parameters:

from  The vector of responses to install into into.
into  The Design to which the responses belong and into which they must be written.

8.52.3.5  std::size_t GetNumberNonLinearConstraints () const  [inline, protected]

Returns the number of non-linear constraints for the problem. This is computed by adding the number of non-linear equality constraints to the number of non-linear inequality constraints. These values are obtained from the model.
Returns:

The total number of non-linear constraints.

8.52.3.6  
\texttt{std::size\_t GetNumberLinearConstraints () const} \ [inline, protected] 

Returns the number of linear constraints for the problem.
This is computed by adding the number of linear equality constraints to the number of linear inequality constraints.
These values are obtained from the model.

Returns:

The total number of linear constraints.

8.52.3.7  
\texttt{bool Evaluate (DesignGroup \& group) \ [virtual]} 

Does evaluation of each design in \texttt{group}.

This method uses the \texttt{Model} known by this class to get Designs evaluated. It properly formats the Design class information in a way that Dakota will understand and then interprets the Dakota results and puts them back into the Design class object. It respects the asynchronous flag in the Model so evaluations may occur synchronously or asynchronously.

Prior to evaluating a Design, this class checks to see if it is marked as already evaluated. If it is, then the evaluation of that Design is not carried out. This is not strictly necessary because Dakota keeps track of evaluated designs and does not re-evaluate. An exception is the case of a population read in from a file complete with responses where Dakota is unaware of the evaluations.

Parameters:

\texttt{group} \ The group of Design class objects to be evaluated.

Returns:

true if all evaluations completed and false otherwise.

8.52.3.8  
\texttt{virtual bool Evaluate (Design \& des) \ [inline, virtual]} 

This method cannot be used!!

This method does nothing and cannot be called. This is because in the case of asynchronous evaluation, this method would be unable to conform. It would require that each evaluation be done in a synchronous fashion.

Parameters:

\texttt{des} \ A Design that would be evaluated if this method worked.

Returns:

Would return true if the Design were evaluated and false otherwise. Never actually returns here. Issues a fatal error. Otherwise, it would always return false.
8.52.3.9 virtual std::string GetName () const [inline, virtual]

Returns the proper name of this operator.

Returns:
See Name().

8.52.3.10 virtual std::string GetDescription () const [inline, virtual]

Returns a full description of what this operator does and how.

Returns:
See Description().

8.52.3.11 virtual GeneticAlgorithmOperator* Clone (GeneticAlgorithm & algorithm) const [inline, virtual]

Creates and returns a pointer to an exact duplicate of this operator.

Parameters:

algorithm The GA for which the clone is being created.

Returns:
A clone of this operator.

8.52.4 Member Data Documentation

8.52.4.1 Model& _model [private]

The Model known by this evaluator.

It is through this model that evaluations will take place.

The documentation for this class was generated from the following file:

- JEGAOptimizer.C
8.53 JEGAOptimizer::EvaluatorCreator Class Reference

A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a Evaluator.

Public Member Functions

- virtual GeneticAlgorithmEvaluator ∗ CreateEvaluator (GeneticAlgorithm &alg)
  
  Overriden to return a newly created Evaluator.

- EvaluatorCreator (Model &theModel)
  
  Constructs an EvaluatorCreator using the supplied model.

Private Attributes

- Model & _theModel
  
  The user defined model to be passed to the constructor of the Evaluator.

8.53.1 Detailed Description

A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a Evaluator.

8.53.2 Constructor & Destructor Documentation

8.53.2.1 EvaluatorCreator (Model & theModel) [inline]

Constructs an EvaluatorCreator using the supplied model.

Parameters:

- theModel The Dakota::Model this creator will pass to the created evaluator.

8.53.3 Member Function Documentation

8.53.3.1 virtual GeneticAlgorithmEvaluator* CreateEvaluator (GeneticAlgorithm & alg) [inline, virtual]

Overriden to return a newly created Evaluator.

The GA will assume ownership of the evaluator so we needn’t worry about keeping track of it for destruction. The additional parameters needed by the Evaluator are stored as members of this class at construction time.

Parameters:

- alg The GA for which the evaluator is to be created.
Returns:

A pointer to a newly created Evaluator.

The documentation for this class was generated from the following file:

- JEGAOptimizer.C
8.54  LeastSq Class Reference

Base class for the nonlinear least squares branch of the iterator hierarchy.

Inheritance diagram for LeastSq:

```
  Iterator
    ↓
  Minimizer
    ↓
LeastSq

NL2SOLLeastSq  NLSSOLLeastSq  SNLLLeastSq
```

Protected Member Functions

- **LeastSq ()**
  - default constructor

- **LeastSq (Model &model)**
  - standard constructor

- **LeastSq (NoDBBaseConstructor, Model &model)**
  - alternate constructor

- **~LeastSq ()**
  - destructor

- void initialize_run ()
- void run ()
  - and may include pre/post steps in lieu of separate pre/post

- void post_run (std::ostream &s)
- void finalize_run ()
  - deallocation and resetting of instance pointers

- void print_results (std::ostream &s)
- virtual void minimize_residuals ()=0
  - for the least squares branch.

- void read_observed_data ()
  - read user data file to load observed data points

void get_confidence_intervals()

Calculate confidence intervals on estimated parameters.

Static Protected Member Functions

- static void primary_resp_recast (const Variables &native_vars, const Variables &scaled_vars, const Response &native_response, Response &scaled_response)

(user) to iterator space

Protected Attributes

- int numLeastSqTerms

number of least squares terms

- LeastSq * prevLSqInstance

pointer containing previous value of leastSqInstance

- bool weightFlag

flag indicating whether weighted least squares is active

- String obsDataFilename

filename from which to read observed data

- bool obsDataFlag

flag indicating whether user-supplied data is active

- RealArray obsData

storage for user-supplied data for computing residuals

- RealVector confBoundsLower

lower bounds for confidence intervals on calibration parameters

- RealVector confBoundsUpper

upper bounds for confidence intervals on calibration parameters

Static Protected Attributes

- static LeastSq * leastSqInstance

pointer to LeastSq instance used in static member functions
8.54.1 Detailed Description

Base class for the nonlinear least squares branch of the iterator hierarchy. The LeastSq class provides common data and functionality for least squares solvers (including NL2OL, NLSSOLLeastSq, and SNLLLeastSq).

8.54.2 Constructor & Destructor Documentation

8.54.2.1 LeastSq (Model & model) [protected]

standard constructor
This constructor extracts the inherited data for the least squares branch and performs sanity checking on gradient and constraint settings.

8.54.3 Member Function Documentation

8.54.3.1 void initialize_run () [protected, virtual]

This function should be invoked (or reimplemented) by any derived implementations of initialize_run() (which would otherwise hide it).
Reimplemented from Minimizer.
Reimplemented in SNLLLeastSq.

8.54.3.2 void run () [inline, protected, virtual]

and may include pre/post steps in lieu of separate pre/post
Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.
Reimplemented from Iterator.

8.54.3.3 void post_run (std::ostream & s) [protected, virtual]

Implements portions of post_run specific to LeastSq for scaling back to native variables and functions. This function should be invoked (or reimplemented) by any derived implementations of post_run() (which would otherwise hide it).
Reimplemented from Iterator.
Reimplemented in SNLLLeastSq.

8.54.3.4 void finalize_run () [inline, protected, virtual]

deallocation and resetting of instance pointers
Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent's `finalize_run()`, typically _after_ performing its own implementation steps.

Reimplemented from `Minimizer`.

Reimplemented in `SNLLLeastSq`.

### 8.54.3.5 void print_results (std::ostream & s) [protected, virtual]

Redefines default iterator results printing to include nonlinear least squares results (residual terms and constraints).

Reimplemented from `Iterator`.

### 8.54.3.6 void primary RESP_recast (const Variables & native_vars, const Variables & scaled_vars, const Response & native_response, Response & iterator_response) [static, protected]

(user) to iterator space

Least squares function map from user/native space to iterator/scaled space using a `RecastModel`. If no scaling also copies constraints.

### 8.54.3.7 void read_observed_data () [protected]

read user data file to load observed data points

read user’s observation data for computation of least squares residuals (currently reading on all processors – need to read once and broadcast)

### 8.54.3.8 void get_confidence_intervals () [protected]

Calculate confidence intervals on estimated parameters.

Calculate individual confidence intervals for each parameter. These bounds are based on a linear approximation of the nonlinear model.

The documentation for this class was generated from the following files:

- DakotaLeastSq.H
- DakotaLeastSq.C
8.55 MergedConstraints Class Reference

the merged data view.

Inheritance diagram for MergedConstraints:

```
Constraints
    MergedConstraints
```

Public Member Functions

- MergedConstraints (const SharedVariablesData &svd)
  lightweight constructor

- MergedConstraints (const ProblemDescDB &problem_db, const SharedVariablesData &svd)
  standard constructor

- ~MergedConstraints ()
  destructor

- void write (std::ostream &s) const
  write a variable constraints object to an std::ostream

- void read (std::istream &s)
  read a variable constraints object from an std::istream

Protected Member Functions

- void reshape (const SizetArray &vc_totals)
  reshape the lower/upper bound arrays within the Constraints hierarchy

- void build_active_views ()
  construct active views of all variables bounds arrays

- void build_inactive_views ()
  construct inactive views of all variables bounds arrays
8.55 MergedConstraints Class Reference

8.55.1 Detailed Description

deferred variable constraints classes take different views of the design, uncertain, and state variable types and the continuous and discrete domain types. The MergedConstraints derived class combines continuous and discrete domain types but separates design, uncertain, and state variable types. The result is merged design bounds arrays (mergedDesignLowerBnds, mergedDesignUpperBnds), uncertain distribution bounds arrays (uncertainLowerBnds, uncertainUpperBnds), and merged state bounds arrays (mergedStateLowerBnds, mergedStateUpperBnds). The branch and bound strategy uses this approach (see Variables::get_variables(problem_db) for variables type selection; variables type is passed to the Constraints constructor in Model).

8.55.2 Constructor & Destructor Documentation

8.55.2.1 MergedConstraints (const ProblemDescDB & problem_db, const SharedVariablesData & svd)

standard constructor

In this class, a merged data approach is used in which continuous and discrete arrays are combined into a single continuous array (integrality is relaxed; the converse of truncating reals is not currently supported but could be in the future if needed). Iterators/strategies which use this class include: BranchBndOptimizer. Extract fundamental lower and upper bounds and merge continuous and discrete domains to create mergedDesignLowerBnds, mergedDesignUpperBnds, mergedStateLowerBnds, and mergedStateUpperBnds.

8.55.3 Member Function Documentation

8.55.3.1 void reshape (const SizetArray & vc_totals) [protected, virtual]

reshape the lower/upper bound arrays within the Constraints hierarchy

Resizes the derived bounds arrays.

Reimplemented from Constraints.

The documentation for this class was generated from the following files:

- MergedConstraints.H
- MergedConstraints.C
8.56 MergedVariables Class Reference

merged data view.

  variablesComponents

- **void** build_active_views ()
  construct active views of all variables arrays
• void build_inactive_views ()

construct inactive views of all variables arrays

8.56.1 Detailed Description

merged data view.

Derived variables classes take different views of the design, uncertain, and state variable types and the continuous and discrete domain types. The MergedVariables derived class combines continuous and discrete domain types but separates design, uncertain, and state variable types. The result is a single continuous array of design variables (mergedDesignVars), a single continuous array of uncertain variables (uncertainVars), and a single continuous array of state variables (mergedStateVars). The branch and bound strategy uses this approach (see Variables::get_-variables(problem_db)).

8.56.2 Constructor & Destructor Documentation

8.56.2.1 MergedVariables (const ProblemDescDB & problem_db, const std::pair< short, short > & view)

standard constructor

In this class, a merged data approach is used in which continuous and discrete arrays are combined into a single continuous array (integrality is relaxed; the converse of truncating reals is not currently supported but could be in the future if needed). Iterators/strategies which use this class include: BranchBndOptimizer. Extract fundamental variable types and labels and merge continuous and discrete domains to create aggregate arrays and views.

8.56.3 Member Function Documentation

8.56.3.1 void read_tabular (std::istream & s) [protected, virtual]

Presumes variables object is appropriately sized to receive data
Reimplemented from Variables.

• MergedVariables.C
8.57 Minimizer Class Reference

iterator hierarchy.

Inheritance diagram for Minimizer:

```
Protected Member Functions

- Minimizer ()
  default constructor

- Minimizer (Model &model)
  standard constructor

- Minimizer (NoDBBaseConstructor, Model &model)
  alternate constructor for "on the fly" instantiations

- Minimizer (NoDBBaseConstructor, size_t num_lin_ineq, size_t num_lin_eq, size_t num_nln_ineq, size_t num_nln_eq)
  alternate constructor for "on the fly" instantiations

- ~Minimizer ()
  destructor

- void initialize_run ()
  typically memory initialization; setting of instance pointers

- void finalize_run ()
  deallocation and resetting of instance pointers
```
• void initialize_scaling()
  checking

• void compute_scaling (int object_type, int auto_type, int num_vars, RealVector &lbs, RealVector &ubs, RealVector &targets, const StringArray &scale_strings, const RealVector &scales, IntArray &scale_types, RealVector &scale_mults, RealVector &scale_offsets)
  vector of variables, functions, constraints, etc.

• bool compute_scale_factor (const Real lower_bound, const Real upper_bound, Real *multiplier, Real *offset)
  automatically compute a single scaling factor – bounds case

• bool compute_scale_factor (const Real target, Real *multiplier)
  automatically compute a single scaling factor – target case

• bool need_resp_trans_byvars (const ShortArray &asv, int start_index, int num_resp)
  transformations

• RealVector modify_n2s (const RealVector &native_vars, const IntArray &scale_types, const RealVector &multipliers, const RealVector &offsets) const
  general RealVector mapping from native to scaled variables vectors:

• RealVector modify_s2n (const RealVector &scaled_vars, const IntArray &scale_types, const RealVector &multipliers, const RealVector &offsets) const
  general RealVector mapping from scaled to native variables (and values)

• void response_modify_n2s (const Variables &scaled_vars, const Response &native_response, Response &scaled_response, int native_offset, int recast_offset, int num_responses) const
  map responses from native to scaled variable space

• void response_modify_s2n (const Variables &native_vars, const Response &scaled_response, Response &native_response, int scaled_offset, int native_offset, int num_responses) const
  map responses from scaled to native variable space

• RealMatrix lin_coeffs_modify_n2s (const RealMatrix &native_coeffs, const RealVector &cv_multipliers, const RealVector &lin_multipliers) const
  general linear coefficients mapping from native to scaled space

• void print_scaling (const String &info, const IntArray &scale_types, const RealVector &scale_mults, const RealVector &scale_offsets, const StringArray &labels)
  print scaling information for a particular response type in tabular form

Static Protected Member Functions

• static void variables_recast (const Variables &scaled_vars, Variables &native_vars)
variables from scaled to native (user) space

- static void secondary_resp_recast (const Variables &native_vars, const Variables &scaled_vars, const Response &native_response, Response &scaled_response)
  transform constraints (fns, grads, Hessians) from native (user) to

Protected Attributes

- Real constraintTol
  optimizer/least squares constraint tolerance

- Real bigRealBoundSize
  cutoff value for inequality constraint and continuous variable bounds

- int bigIntBoundSize
  cutoff value for discrete variable bounds

- size_t numNonlinearIneqConstraints
  number of nonlinear inequality constraints

- size_t numNonlinearEqConstraints
  number of nonlinear equality constraints

- size_t numLinearIneqConstraints
  number of linear inequality constraints

- size_t numLinearEqConstraints
  number of linear equality constraints

- int numNonlinearConstraints
  total number of nonlinear constraints

- int numLinearConstraints
  total number of linear constraints

- int numConstraints
  total number of linear and nonlinear constraints

- bool boundConstraintFlag
  constraints. Used for method selection and error checking.

- bool speculativeFlag
  flag for speculative gradient evaluations

- size_t numUserPrimaryFns
number of objective functions or least squares terms in the user’s model

- `size_t numIterPrimaryFns`
  number of objective functions or least squares terms in iterator’s view

- `bool scaleFlag`
  flag for overall scaling status

- `bool varsScaleFlag`
  flag for variables scaling

- `bool primaryRespScaleFlag`
  flag for primary response scaling

- `bool secondaryRespScaleFlag`
  flag for secondary response scaling

- `IntArray cvScaleTypes`
  scale flags for continuous vars.

- `RealVector cvScaleMultipliers`
  scales for continuous variables

- `RealVector cvScaleOffsets`
  offsets for continuous variables

- `IntArray responseScaleTypes`
  scale flags for all responses

- `RealVector responseScaleMultipliers`
  scales for all responses

- `RealVector responseScaleOffsets`
  offsets for all responses (zero for functions, not for nonlin con)

- `IntArray linearIneqScaleTypes`
  scale flags for linear ineq

- `RealVector linearIneqScaleMultipliers`
  scales for linear ineq constrs.

- `RealVector linearIneqScaleOffsets`
  offsets for linear ineq constrs.

- `IntArray linearEqScaleTypes`
  scale flags for linear eq.
• RealVector linearEqScaleMultipliers
  scales for linear constraints

• RealVector linearEqScaleOffsets
  offsets for linear constraints

• Minimizer * prevMinInstance
  pointer containing previous value of minimizerInstance

• bool vendorNumericalGradFlag
  convenience flag for gradType == numerical && methodSource == vendor

**Static Protected Attributes**

• static Minimizer * minimizerInstance
  pointer to Minimizer used in static member functions

**Friends**

• class SOLBase
  access to iterator hierarchy data (to avoid attribute replication)

• class SNLLBase
  access to iterator hierarchy data (to avoid attribute replication)

**8.57.1 Detailed Description**

iterator hierarchy.

The Minimizer class provides common data and functionality for Optimizer and LeastSq.

**8.57.2 Constructor & Destructor Documentation**

**8.57.2.1 Minimizer (Model & model) [protected]**

standard constructor

This constructor extracts inherited data for the optimizer and least squares branches and performs sanity checking on constraint settings.
8.57.3 Member Function Documentation

8.57.3.1 void initialize_run () [protected, virtual]

typically memory initialization; setting of instance pointers
Perform initialization phases of run sequence, like allocating memory and setting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s initialize_run(), typically _before_ performing its own implementation steps.
Reimplemented from Iterator.
Reimplemented in CONMINOptimizer, LeastSq, Optimizer, DOTOptimizer, NLPQLPOptimizer, SNLLLeastSq, and SNLLOptimizer.

8.57.3.2 void finalize_run () [inline, protected, virtual]
deallocation and resetting of instance pointers
Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s finalize_run(), typically _after_ performing its own implementation steps.
Reimplemented from Iterator.
Reimplemented in LeastSq, Optimizer, SNLLLeastSq, and SNLLOptimizer.

8.57.3.3 void initialize_scaling () [protected]
checking
helper function used in constructors of derived classes to set up scaling types, multipliers and offsets when input scaling flag is enabled

8.57.3.4 void variables_recast (const Variables & scaled_vars, Variables & native_vars) [static, protected]
variables from scaled to native (user) space
Variables map from iterator/scaled space to user/native space using a RecastModel.

8.57.3.5 void secondary.resp_recast (const Variables & native_vars, const Variables & scaled_vars, const Response & native_response, Response & iterator_response) [static, protected]
transform constraints (fns, grads, Hessians) from native (user) to
Constraint function map from user/native space to iterator/scaled/combined space using a RecastModel.
8.57.3.6 bool need_resp_trans_byvars (const ShortArray & asv, int start_index, int num_resp) [protected]
transformations
Determine if variable transformations present and derivatives requested, which implies a response transformation is necessary

8.57.3.7 RealVector modify_n2s (const RealVector & native_vars, const IntArray & scale_types, const RealVector & multipliers, const RealVector & offsets) const [protected]
genereal RealVector mapping from native to scaled variables vectors:
genereal RealVector mapping from native to scaled variables; loosely, in greatest generality: scaled_var = log((native_var - offset) / multiplier )

8.57.3.8 RealVector modify_s2n (const RealVector & scaled_vars, const IntArray & scale_types, const RealVector & multipliers, const RealVector & offsets) const [protected]
genereal RealVector mapping from scaled to native variables and/or vals; loosely, in greatest generality: scaled_var = (LOG_BASE^scaled_var) * multiplier + offset

8.57.3.9 void response_modify_n2s (const Variables & native_vars, const Response & native_response, Response & recast_response, int native_offset, int recast_offset, int num_responses) const [protected]
map responses from native to scaled variable space
scaling response mapping: modifies response from a model (user/native) for use in iterators (scaled) – not including multi_objective_modify

8.57.3.10 void response_modify_s2n (const Variables & native_vars, const Response & scaled_response, Response & native_response, int scaled_offset, int native_offset, int num_responses) const [protected]
map responses from scaled to native variable space
scaling response mapping: modifies response from scaled (iterator) to native (user) space – not including multi_-objective_retrieve

8.57.3.11 RealMatrix lin_coeffs_modify_n2s (const RealMatrix & src_coeffs, const RealVector & ev_multipliers, const RealVector & lin_multipliers) const [protected]
genereal linear coefficients mapping from native to scaled space
compute scaled linear constraint matrix given design variable multipliers and linear scaling multipliers. Only scales components corresponding to continuous variables so for src_coeffs of size MxN, lin_multipliers.size() <=
M. cv_multipliers.size() \leq N

8.58 MixedConstraints Class Reference

8.58.1 Detailed Description

the default data view (no variable or domain type array merging).

Derived variable constraints classes take different views of the design, uncertain, and state variable types and the continuous and discrete domain types. The MixedConstraints derived class separates the design, uncertain, and state variable types as well as the continuous and discrete domain types. The result is separate lower and upper bounds arrays for continuous design, discrete design, uncertain, continuous state, and discrete state variables. This is the default approach, so all iterators and strategies not specifically utilizing the All or Merged views use this approach (see Variables::get_variables(problem_db) for variables type selection; variables type is passed to the Constraints constructor in Model).

8.58.2 Constructor & Destructor Documentation

8.58.2.1 MixedConstraints (const ProblemDescDB & problem_db, const SharedVariablesData & svd)

standard constructor

In this class, mixed continuous/discrete variables are used. Most iterators/strategies use this approach, which is the default in Constraints::get_constraints().

8.58.3 Member Function Documentation

8.58.3.1 void reshape (const SizetArray & vc_totals) [protected, virtual]

reshape the lower/upper bound arrays within the Constraints hierarchy

Resizes the derived bounds arrays.

Reimplemented from Constraints.

8.59.1 Detailed Description

the default data view (no variable or domain type array merging).

Derived variables classes take different views of the design, uncertain, and state variable types and the continuous and discrete domain types. The MixedVariables derived class separates the design, uncertain, and state variable types as well as the continuous and discrete domain types. The result is separate arrays for continuous design, discrete design, uncertain, continuous state, and discrete state variables. This is the default approach, so all iterators and strategies not specifically utilizing the All or Merged views use this approach (see Variables::get_variables(problem_db)).

8.59.2 Constructor & Destructor Documentation

8.59.2.1 MixedVariables (const ProblemDescDB & problem_db, const std::pair< short, short > & view)

standard constructor

In this class, the distinct approach is used (design, uncertain, and state variable types and continuous and discrete domain types are distinct). Most iterators/strategies use this approach.

8.59.3 Member Function Documentation

8.59.3.1 void read_tabular (std::istream & s) [protected, virtual]

Presumes variables object is already appropriately sized to receive!

Reimplemented from Variables.

8.60 Model Class Reference

Base class for the model class hierarchy.

Inheritance diagram for Model:

- Model
  - NestedModel
  - RecastModel
  - SingleModel
  - SurrogateModel
    - DataFitSurrModel
    - HierarchSurrModel

Public Member Functions

- Model ()
  default constructor

- Model (ProblemDescDB &problem_db)
  standard constructor for envelope

- Model (const Model &model)
  copy constructor

- virtual ~Model ()
  destructor

- Model operator= (const Model &model)
  assignment operator

- virtual Iterator & subordinate_iterator ()
  return the sub-iterator in nested and surrogate models

- virtual Model & subordinate_model ()
  dive through model recursions that may bypass some components.

- virtual Model & surrogate_model ()
  return the approximation sub-model in surrogate models

- virtual Model & truth_model ()
  return the truth sub-model in surrogate models

- virtual void derived_subordinate_models (ModelList &ml, bool recurse_flag)
  portion of subordinate_models() specific to derived model classes
virtual void update_from_subordinate_model (bool recurse_flag=true)
  propagate vars/labels/bounds/targets from the bottom up

virtual Interface & interface ()
  or NestedModel::optionalInterface

virtual void primary_response_fn_weights (const RealVector &wts, bool recurse_flag=true)
  squares terms

virtual void surrogate_bypass (bool bypass_flag)
  models contained within this model

virtual void surrogate_function_indices (const IntSet &surr_fn_indices)
  set the (currently active) surrogate function index set

virtual void build_approximation ()
  build a new SurrogateModel approximation

virtual bool build_approximation (const Variables &vars, const Response &response)
  response at vars

virtual void update_approximation (bool rebuild_flag)
  based on data updates propagated elsewhere

virtual void update_approximation (const Variables &vars, const Response &response, bool rebuild_flag)
  replace the anchor point data within an existing surrogate

virtual void update_approximation (const VariablesArray &vars_array, const ResponseArray &resp_array, bool rebuild_flag)
  replace the data points within an existing surrogate

virtual void append_approximation (bool rebuild_flag)
  based on data updates propagated elsewhere

virtual void append_approximation (const Variables &vars, const Response &response, bool rebuild_flag)
  append a single point to an existing surrogate’s data

virtual void append_approximation (const VariablesArray &vars_array, const ResponseArray &resp_array, bool rebuild_flag)
  append multiple points to an existing surrogate’s data

virtual void pop_approximation (bool save_sdp_set)
  of SurrogateDataPoint set for use in restore_approximation()

virtual void restore_approximation ()
  restore a previous approximation data state within a surrogate
• virtual bool restore_available ()
  query for whether a trial increment is restorable within a surrogate

• virtual void finalize_approximation ()
  finalize an approximation by applying all previous trial increments

• virtual bool force_rebuild ()
  based on changes in the inactive data

• virtual std::vector< Approximation > & approximations ()
  retrieve the set of Approximations within a DataFitSurrModel

• virtual const RealVectorArray & approximation_coefficients ()
  within a DataFitSurrModel

• virtual void approximation_coefficients (const RealVectorArray &approx_coeffs)
  a DataFitSurrModel

• virtual const RealVector & approximation_variances (const RealVector &c_vars)
  Approximation within a DataFitSurrModel.

• virtual const SDPList & approximation_data (size_t index)
  instance within a DataFitSurrModel

• virtual void compute_correction (const Response &truth_response, const Response &approx_response,
  const RealVector &c_vars)
  compute correction factors for use in SurrogateModels

• virtual void auto_correction (bool correction_flag)
  manages automatic application of correction factors in SurrogateModels

• virtual bool auto_correction ()
  model's responses

• virtual void apply_correction (Response &approx_response, const RealVector &c_vars, bool quiet_flag=false)
  apply correction factors to approx_response (for use in SurrogateModels)

• virtual void component_parallel_mode (short mode)
  or 2 (SUB_MODEL/ACTUAL_MODEL/HF_MODEL/TRUTH_MODEL)].

• virtual String local_eval_synchronization ()
  return derived model synchronization setting

• virtual int local_eval_concurrency ()
return derived model asynchronous evaluation concurrency

- virtual void serve ()
  a termination message is received from stop_servers().

- virtual void stop_servers ()
  particular model when iteration on the model is complete.

- virtual bool derived_master_overload () const
  of trying to run a multiprocessor job on the master.

- virtual void inactive_view (short view, bool recurse_flag=true)
  update the Model’s inactive view based on higher level (nested) context

- virtual const String & interface_id () const
  return the interface identifier

- virtual int evaluation_id () const
  Return the current function evaluation id for the Model.

- virtual void set_evaluation_reference ()
  Set the reference points for the evaluation counters within the Model.

- virtual void fine_grained_evaluation_counters ()
  Request fine-grained evaluation reporting within the Model.

- virtual void print_evaluation_summary (std::ostream &s, bool minimal_header=false, bool relative_count=true) const
  Print an evaluation summary for the Model.

- ModelList & subordinate_models (bool recurse_flag=true)
  return the sub-models in nested and surrogate models

- void compute_response ()
  Compute the Response at currentVariables (default ActiveSet).

- void compute_response (const ActiveSet &set)
  Compute the Response at currentVariables (specified ActiveSet).

- void asynch_compute_response ()
  Response at currentVariables (default ActiveSet).

- void asynch_compute_response (const ActiveSet &set)
  Response at currentVariables (specified ActiveSet).

- const IntResponseMap & synchronize ()
complete set of results from a group of asynchronous evaluations.

- const IntResponseMap & synchronize_nowait()
  available results from a group of asynchronous evaluations.

- void init_communicators(const int &max_iterator_concurrency, bool recurse_flag=true)
  configuration in modelPCIterMap

- void init_serial()
  modify some default settings to behave properly in serial.

- void set_communicators(const int &max_iterator_concurrency, bool recurse_flag=true)
  from modelPCIterMap

- void free_communicators(const int &max_iterator_concurrency, bool recurse_flag=true)
  deallocate communicator partitions for a model

- void stop_configurations()
  terminate serve_configurations() on other iteratorComm processors

- int serve_configurations()
  to balance init_communicators() calls on iteratorComm rank 0

- void estimate_message_lengths()
  estimate messageLengths for a model

- void assign_rep(Model *model_rep, bool ref_count_incr=true)
  replaces existing letter with a new one

- size_t tv() const
  returns total number of vars

- size_t cv() const
  returns number of active continuous variables

- size_t div() const
  returns number of active discrete integer vars

- size_t drv() const
  returns number of active discrete real vars

- size_t icv() const
  returns number of inactive continuous variables

- size_t idiv() const
  returns number of inactive discrete integer vars
- `size_t idrv () const`
  
  returns number of inactive discrete real vars

- `size_t acv () const`
  
  returns total number of continuous variables

- `size_t adiv () const`
  
  returns total number of discrete integer vars

- `size_t adrv () const`
  
  returns total number of discrete real vars

- `void active_variables (const Variables &vars)`
  
  set the active variables in currentVariables

- `const RealVector & continuous_variables () const`
  
  return the active continuous variables from currentVariables

- `void continuous_variables (const RealVector &c_vars)`
  
  set the active continuous variables in currentVariables

- `void continuous_variable (const Real &c_var, const size_t &i)`
  
  set an active continuous variable in currentVariables

- `const IntVector & discrete_int_variables () const`
  
  return the active discrete integer variables from currentVariables

- `void discrete_int_variables (const IntVector &d_vars)`
  
  set the active discrete integer variables in currentVariables

- `void discrete_int_variable (const int &d_var, const size_t &i)`
  
  set an active discrete integer variable in currentVariables

- `const RealVector & discrete_real_variables () const`
  
  return the active discrete real variables from currentVariables

- `void discrete_real_variables (const RealVector &d_vars)`
  
  set the active discrete real variables in currentVariables

- `void discrete_real_variable (const Real &d_var, const size_t &i)`
  
  set an active discrete real variable in currentVariables

- `UShortMultiArrayConstView continuous_variable_types () const`
  
  return the active continuous variable types from currentVariables
• UShortMultiArrayConstView discrete_int_variable_types () const
  return the active discrete variable types from currentVariables

• UShortMultiArrayConstView discrete_real_variable_types () const
  return the active discrete variable types from currentVariables

• SizetMultiArrayConstView continuous_variable_ids () const
  return the active continuous variable identifiers from currentVariables

• const RealVector & inactive_continuous_variables () const
  return the inactive continuous variables in currentVariables

• void inactive_continuous_variables (const RealVector &i_c_vars)
  set the inactive continuous variables in currentVariables

• const IntVector & inactive_discrete_int_variables () const
  return the inactive discrete variables in currentVariables

• void inactive_discrete_int_variables (const IntVector &i_d_vars)
  set the inactive discrete variables in currentVariables

• const RealVector & inactive_discrete_real_variables () const
  return the inactive discrete variables in currentVariables

• void inactive_discrete_real_variables (const RealVector &i_d_vars)
  set the inactive discrete variables in currentVariables

• SizetMultiArrayConstView inactive_continuous_variable_ids () const
  return the inactive continuous variable identifiers from currentVariables

• const RealVector & all_continuous_variables () const
  return all continuous variables in currentVariables

• void all_continuous_variables (const RealVector &a_c_vars)
  set all continuous variables in currentVariables

• void all_continuous_variable (const Real &a_c_var, const size_t &i)
  set a variable within the all continuous variables in currentVariables

• const IntVector & all_discrete_int_variables () const
  return all discrete variables in currentVariables

• void all_discrete_int_variables (const IntVector &a_d_vars)
  set all discrete variables in currentVariables

• void all_discrete_int_variable (const int &a_d_var, const size_t &i)
set a variable within the all discrete variables in currentVariables

- const RealVector & all_discrete_real_variables () const
  return all discrete variables in currentVariables

- void all_discrete_real_variables (const RealVector & a_d_vars)
  set all discrete variables in currentVariables

- void all_discrete_real_variable (const Real & a_d_var, const size_t &i)
  set a variable within the all discrete variables in currentVariables

- UShortMultiArrayConstView all_continuous_variable_types () const
  return all continuous variable types from currentVariables

- UShortMultiArrayConstView all_discrete_int_variable_types () const
  return all discrete variable types from currentVariables

- UShortMultiArrayConstView all_discrete_real_variable_types () const
  return all discrete variable types from currentVariables

- SizetMultiArrayConstView all_continuous_variable_ids () const
  return all continuous variable identifiers from currentVariables

- const IntSetArray & discrete_design_set_int_values () const
  design set integer variables

- void discrete_design_set_int_values (const IntSetArray & isa)
  design set integer variables

- const RealSetArray & discrete_design_set_real_values () const
  design set integer variables

- void discrete_design_set_real_values (const RealSetArray & rsa)
  design set integer variables

- Pecos::DistributionParams & distribution_parameters ()
  return distribParams

- void distribution_parameters (const Pecos::DistributionParams & dp)
  set distribParams

- const IntSetArray & discrete_state_set_int_values () const
  state set integer variables

- void discrete_state_set_int_values (const IntSetArray & isa)
  state set integer variables
• const RealSetArray & discrete_state_set_real_values() const
  return the active discrete real variable labels in currentVariables

• void discrete_state_set_real_values(const RealSetArray &rsa)
  set the active discrete real variable labels in currentVariables

• StringMultiArrayConstView continuous_variable_labels() const
  return the active continuous variable labels from currentVariables

• void continuous_variable_labels(StringMultiArrayConstView c_v_labels)
  set the active continuous variable labels in currentVariables

• StringMultiArrayConstView discrete_int_variable_labels() const
  return the active discrete integer variable labels from currentVariables

• void discrete_int_variable_labels(StringMultiArrayConstView d_v_labels)
  set the active discrete integer variable labels in currentVariables

• StringMultiArrayConstView discrete_real_variable_labels() const
  return the active discrete real variable labels from currentVariables

• void discrete_real_variable_labels(StringMultiArrayConstView d_v_labels)
  set the active discrete real variable labels in currentVariables

• StringMultiArrayConstView inactive_continuous_variable_labels() const
  return the inactive continuous variable labels in currentVariables

• void inactive_continuous_variable_labels(StringMultiArrayConstView i_c_v_labels)
  set the inactive continuous variable labels in currentVariables

• StringMultiArrayConstView inactive_discrete_int_variable_labels() const
  return the inactive discrete integer variable labels in currentVariables

• void inactive_discrete_int_variable_labels(StringMultiArrayConstView i_d_v_labels)
  set the inactive discrete integer variable labels in currentVariables

• StringMultiArrayConstView inactive_discrete_real_variable_labels() const
  return the inactive discrete real variable labels in currentVariables

• void inactive_discrete_real_variable_labels(StringMultiArrayConstView i_d_v_labels)
  set the inactive discrete real variable labels in currentVariables

• StringMultiArrayConstView all_continuous_variable_labels() const
  return all continuous variable labels in currentVariables
• void all_continuous_variable_labels (StringMultiArrayConstView a_c_v_labels)
  set all continuous variable labels in currentVariables

• void all_continuous_variable_label (const String &a_c_v_label, const size_t &i)
  set a label within the all continuous labels in currentVariables

• StringMultiArrayConstView all_discrete_int_variable_labels () const
  return all discrete variable labels in currentVariables

• void all_discrete_int_variable_labels (StringMultiArrayConstView a_d_v_labels)
  set all discrete variable labels in currentVariables

• void all_discrete_int_variable_label (const String &a_d_v_label, const size_t &i)
  set a label within the all discrete labels in currentVariables

• StringMultiArrayConstView all_discrete_real_variable_labels () const
  return all discrete variable labels in currentVariables

• void all_discrete_real_variable_labels (StringMultiArrayConstView a_d_v_labels)
  set all discrete variable labels in currentVariables

• void all_discrete_real_variable_label (const String &a_d_v_label, const size_t &i)
  set a label within the all discrete labels in currentVariables

• const StringArray & response_labels () const
  return the response labels from currentResponse

• void response_labels (const StringArray &resp_labels)
  set the response labels in currentResponse

• const RealVector & continuous_lower_bounds () const
  return the active continuous lower bounds from userDefinedConstraints

• void continuous_lower_bounds (const RealVector &c_l_bnds)
  set the active continuous lower bounds in userDefinedConstraints

• const RealVector & continuous_upper_bounds () const
  return the active continuous upper bounds from userDefinedConstraints

• void continuous_upper_bounds (const RealVector &c_u_bnds)
  set the active continuous upper bounds in userDefinedConstraints

• const IntVector & discrete_int_lower_bounds () const
  return the active discrete lower bounds from userDefinedConstraints

• void discrete_int_lower_bounds (const IntVector &d_l_bnds)
set the active discrete lower bounds in userDefinedConstraints

- `const IntVector & discrete_int_upper_bounds () const`
  return the active discrete upper bounds from userDefinedConstraints

- `void discrete_int_upper_bounds (const IntVector &d_u_bnds)`
  set the active discrete upper bounds in userDefinedConstraints

- `const RealVector & discrete_real_lower_bounds () const`
  return the active discrete lower bounds from userDefinedConstraints

- `void discrete_real_lower_bounds (const RealVector &d_l_bnds)`
  set the active discrete lower bounds in userDefinedConstraints

- `const RealVector & discrete_real_upper_bounds () const`
  return the active discrete upper bounds from userDefinedConstraints

- `void discrete_real_upper_bounds (const RealVector &d_u_bnds)`
  set the active discrete upper bounds in userDefinedConstraints

- `const RealVector & inactive_continuous_lower_bounds () const`
  return the inactive continuous lower bounds in userDefinedConstraints

- `void inactive_continuous_lower_bounds (const RealVector &i_c_l_bnds)`
  set the inactive continuous lower bounds in userDefinedConstraints

- `const RealVector & inactive_continuous_upper_bounds () const`
  return the inactive continuous upper bounds in userDefinedConstraints

- `void inactive_continuous_upper_bounds (const RealVector &i_c_u_bnds)`
  set the inactive continuous upper bounds in userDefinedConstraints

- `const IntVector & inactive_discrete_int_lower_bounds () const`
  return the inactive discrete lower bounds in userDefinedConstraints

- `void inactive_discrete_int_lower_bounds (const IntVector &i_d_l_bnds)`
  set the inactive discrete lower bounds in userDefinedConstraints

- `const IntVector & inactive_discrete_int_upper_bounds () const`
  return the inactive discrete upper bounds in userDefinedConstraints

- `void inactive_discrete_int_upper_bounds (const IntVector &i_d_u_bnds)`
  set the inactive discrete upper bounds in userDefinedConstraints

- `const RealVector & inactive_discrete_real_lower_bounds () const`
  return the inactive discrete lower bounds in userDefinedConstraints

- `void inactive_discrete_real_lower_bounds (const RealVector &i_d_r_l_bnds)`
  set the inactive discrete lower bounds in userDefinedConstraints

- `const RealVector & inactive_discrete_real_upper_bounds () const`
  return the inactive discrete upper bounds in userDefinedConstraints

- `void inactive_discrete_real_upper_bounds (const RealVector &i_d_r_u_bnds)`
  set the inactive discrete upper bounds in userDefinedConstraints
void inactive_discrete_real_lower_bounds (const RealVector &i_d_l_bnds)

set the inactive discrete lower bounds in userDefinedConstraints

const RealVector & inactive_discrete_real_upper_bounds () const

return the inactive discrete upper bounds in userDefinedConstraints

void inactive_discrete_real_upper_bounds (const RealVector &i_d_u_bnds)

set the inactive discrete upper bounds in userDefinedConstraints

const RealVector & all_continuous_lower_bounds () const

return all continuous lower bounds in userDefinedConstraints

void all_continuous_lower_bounds (const RealVector &a_c_l_bnds)

set all continuous lower bounds in userDefinedConstraints

void all_continuous_lower_bound (const Real &a_c_l_bnd, const size_t &i)

userDefinedConstraints

const RealVector & all_continuous_upper_bounds () const

return all continuous upper bounds in userDefinedConstraints

void all_continuous_upper_bounds (const RealVector &a_c_u_bnds)

set all continuous upper bounds in userDefinedConstraints

void all_continuous_upper_bound (const Real &a_c_u_bnd, const size_t &i)

userDefinedConstraints

const IntVector & all_discrete_int_lower_bounds () const

return all discrete lower bounds in userDefinedConstraints

void all_discrete_int_lower_bounds (const IntVector &a_d_l_bnds)

set all discrete lower bounds in userDefinedConstraints

void all_discrete_int_lower_bound (const int &a_d_l_bnd, const size_t &i)

userDefinedConstraints

const IntVector & all_discrete_int_upper_bounds () const

return all discrete upper bounds in userDefinedConstraints

void all_discrete_int_upper_bounds (const IntVector &a_d_u_bnds)

set all discrete upper bounds in userDefinedConstraints

void all_discrete_int_upper_bound (const int &a_d_u_bnd, const size_t &i)

userDefinedConstraints
• const RealVector & all_discrete_real_lower_bounds () const
  return all discrete lower bounds in userDefinedConstraints

• void all_discrete_real_lower_bounds (const RealVector &a_d_l_bnds)
  set all discrete lower bounds in userDefinedConstraints

• void all_discrete_real_lower_bound (const Real &a_d_l_bnd, const size_t &i)
  userDefinedConstraints

• const RealVector & all_discrete_real_upper_bounds () const
  return all discrete upper bounds in userDefinedConstraints

• void all_discrete_real_upper_bounds (const RealVector &a_d_u_bnds)
  set all discrete upper bounds in userDefinedConstraints

• void all_discrete_real_upper_bound (const Real &a_d_u_bnd, const size_t &i)
  userDefinedConstraints

• size_t num_linear_ineq_constraints () const
  return the number of linear inequality constraints

• size_t num_linear_eq_constraints () const
  return the number of linear equality constraints

• const RealMatrix & linear_ineq_constraint_coeffs () const
  return the linear inequality constraint coefficients

• void linear_ineq_constraint_coeffs (const RealMatrix &lin_ineq_coeffs)
  set the linear inequality constraint coefficients

• const RealVector & linear_ineq_constraint_lower_bounds () const
  return the linear inequality constraint lower bounds

• void linear_ineq_constraint_lower_bounds (const RealVector &lin_ineq_l_bnds)
  set the linear inequality constraint lower bounds

• const RealVector & linear_ineq_constraint_upper_bounds () const
  return the linear inequality constraint upper bounds

• void linear_ineq_constraint_upper_bounds (const RealVector &lin_ineq_u_bnds)
  set the linear inequality constraint upper bounds

• const RealMatrix & linear_eq_constraint_coeffs () const
  return the linear equality constraint coefficients

• void linear_eq_constraint_coeffs (const RealMatrix &lin_eq_coeffs)
set the linear equality constraint coefficients

- const RealVector & linear_eq_constraint_targets() const
  return the linear equality constraint targets

- void linear_eq_constraint_targets(const RealVector &lin_eq_targets)
  set the linear equality constraint targets

- size_t num_nonlinear_ineq_constraints() const
  return the number of nonlinear inequality constraints

- size_t num_nonlinear_eq_constraints() const
  return the number of nonlinear equality constraints

- const RealVector & nonlinear_ineq_constraint_lower_bounds() const
  return the nonlinear inequality constraint lower bounds

- void nonlinear_ineq_constraint_lower_bounds(const RealVector &nln_ineq_l_bnds)
  set the nonlinear inequality constraint lower bounds

- const RealVector & nonlinear_ineq_constraint_upper_bounds() const
  return the nonlinear inequality constraint upper bounds

- void nonlinear_ineq_constraint_upper_bounds(const RealVector &nln_ineq_u_bnds)
  set the nonlinear inequality constraint upper bounds

- const RealVector & nonlinear_eq_constraint_targets() const
  return the nonlinear equality constraint targets

- void nonlinear_eq_constraint_targets(const RealVector &nln_eq_targets)
  set the nonlinear equality constraint targets

- const Variables & current_variables() const
  return the current variables (currentVariables)

- const Constraints & user_defined_constraints() const
  return the user-defined constraints (userDefinedConstraints)

- const Response & current_response() const
  return the current response (currentResponse)

- ProblemDescDB & problem_description_db() const
  return the problem description database (probDescDB)

- ParallelLibrary & parallel_library() const
  return the parallel library (parallelLib)
- **const String & model_type () const**
  
  *return the model type (modelType)*

- **const String & model_id () const**
  
  *return the model identifier (idModel)*

- **size_t num_functions () const**
  
  *return number of functions in currentResponse*

- **const String & gradient_type () const**
  
  *return the gradient evaluation type (gradType)*

- **const String & method_source () const**
  
  *return the numerical gradient evaluation method source (methodSrc)*

- **const String & interval_type () const**
  
  *return the numerical gradient evaluation interval type (intervalType)*

- **bool ignore_bounds () const**
  
  *option for ignoring bounds when numerically estimating derivatives*

- **bool central_hess () const**
  
  *option for using old 2nd-order scheme when computing finite-diff Hessian*

- **const RealVector & fd_gradient_step_size () const**
  
  *return the finite difference gradient step size (fdGradSS)*

- **const IntList & gradient_id_analytic () const**
  
  *return the mixed gradient analytic IDs (gradIdAnalytic)*

- **const IntList & gradient_id_numerical () const**
  
  *return the mixed gradient numerical IDs (gradIdNumerical)*

- **const String & hessian_type () const**
  
  *return the Hessian evaluation type (hessType)*

- **const String & quasi_hessian_type () const**
  
  *return the Hessian evaluation type (quasiHessType)*

- **const RealVector & fd_hessian_by_grad_step_size () const**
  
  *return gradient-based finite difference Hessian step size (fdHessByGradSS)*

- **const RealVector & fd_hessian_by_fn_step_size () const**
  
  *return function-based finite difference Hessian step size (fdHessByFnSS)*
• const IntList & hessian_id_analytic () const
  return the mixed Hessian analytic IDs (hessIdAnalytic)

• const IntList & hessian_id_numerical () const
  return the mixed Hessian analytic IDs (hessIdNumerical)

• const IntList & hessian_id_quasi () const
  return the mixed Hessian analytic IDs (hessIdQuasi)

• const RealVector & primary_response_fn_weights () const
  squares terms. Used by ConcurrentStrategy for Pareto set optimization.

• void supports_estimated_derivatives (bool sed_flag)
  set whether this model should perform or pass on derivative estimation

• void init_comms_bcast_flag (bool icb_flag)
  set initCommsBcastFlag

• int evaluation_capacity () const
  return the evaluation capacity for use in iterator logic

• int derivative_concurrency () const
  return the gradient concurrency for use in parallel configuration logic

• bool asynch_flag () const
  return the asynchronous evaluation flag (asynchEvalFlag)

• void asynch_flag (const bool flag)
  set the asynchronous evaluation flag (asynchEvalFlag)

• short output_level () const
  return the outputLevel

• void output_level (const short level)
  set the outputLevel

• const IntArray & message_lengths () const
  return the array of MPI packed message buffer lengths (messageLengths)

• void parallel_configuration_iterator (const ParConfigLIter &pc_iter)
  set modelPCIter

• const ParConfigLIter & parallel_configuration_iterator () const
  return modelPCIter

• void auto_graphics (const bool flag)
• bool is_null () const
  
  function to check modelRep (does this envelope contain a letter)

• Model * model_rep () const
  
  that are not mapped to the top Model level

• Real FDstep1 (FDhelp *, Real h_mag, size_t i)
  
  function returning finite-difference step size (affected by bounds)

• Real FDstep2 (FDhelp *, Real h, size_t j)
  
  by bounds

Protected Member Functions

• Model (BaseConstructor, ProblemDescDB &problem_db)
  derived class constructors - Coplien, p. 139)

• Model (NoDBBaseConstructor, ParallelLibrary &parallel_lib, const SharedVariablesData &svd, const ActiveSet &set)
  constructed on the fly

• Model (RecastBaseConstructor, ProblemDescDB &problem_db, ParallelLibrary &parallel_lib)
  constructed on the fly

• virtual void derived_compute_response (const ActiveSet &set)
  
  portion of compute_response() specific to derived model classes

• virtual void derived_asynch_compute_response (const ActiveSet &set)
  
  portion of asynch_compute_response() specific to derived model classes

• virtual const IntResponseMap & derived_synchronize ()
  
  portion of synchronize() specific to derived model classes

• virtual const IntResponseMap & derived_synchronize_nowait ()
  
  portion of synchronize_nowait() specific to derived model classes

• virtual void derived_init_communicators (const int &max_iterator_concurrency, bool recurse_flag=true)
  
  portion of init_communicators() specific to derived model classes

• virtual void derived_init_serial ()
  
  portion of init_serial() specific to derived model classes

• virtual void derived_set_communicators (const int &max_iterator_concurrency, bool recurse_flag=true)
portion of set_communicators() specific to derived model classes

- virtual void derived_free_communicators (const int &max_iterator_concurrency, bool recurse_flag=true)
  portion of free_communicators() specific to derived model classes

Protected Attributes

- Variables currentVariables
  function evaluations

- size_t numDerivVars
  corrections where only the active continuous variables are supported

- Response currentResponse
  function evaluations

- size_t numFns
  the number of functions in currentResponse

- Constraints userDefinedConstraints
  an iterator at startup.

- String modelType
  type of model: single, nested, or surrogate

- String surrogateType
  type of surrogate model: local_*, multipoint_*, global_*, or hierarchical

- String gradType
  grad type: none,numerical,analytic,mixed

- String methodSrc
  method source: dakota,vendor

- String intervalType
  interval type: forward,central

- bool ignoreBounds
  option to ignore bounds when computing finite differences

- bool centralHess
  option to use old 2nd-order finite diffs for Hessians

- RealVector fdGradSS
  relative step sizes for numerical gradients
- IntList gradIdAnalytic
  analytic id's for mixed gradients

- IntList gradIdNumerical
  numerical id's for mixed gradients

- String hessType
  Hess type: none, numerical, quasi, analytic, mixed.

- String quasiHessType
  quasi-Hessian type: bfgs, damped_bfgs, sr1

- RealVector fdHessByGradSS
  relative step sizes for numerical Hessians estimated with 1st-order grad differences

- RealVector fdHessByFnSS
  relative step sizes for numerical Hessians estimated with 2nd-order fn differences

- IntList hessIdAnalytic
  analytic id's for mixed Hessians

- IntList hessIdNumerical
  numerical id's for mixed Hessians

- IntList hessIdQuasi
  quasi id's for mixed Hessians

- bool supportsEstimDerivs
  whether model should perform or forward derivative estimation

- IntArray messageLengths
  and PRPair

- ProblemDescDB & probDescDB
  class member reference to the problem description database

- ParallelLibrary & parallelLib
  class member reference to the parallel library

- ParConfigLIter modelPCIter
  the ParallelConfiguration node used by this model instance

- short componentParallelMode
  (SUB_MODEL/HF_MODEL/TRUTH_MODEL)
• `bool asynchEvalFlag`
  flags asynch evaluations (local or distributed)

• `short outputLevel`
  output verbosity level: {SILENT, QUIET, NORMAL, VERBOSE, DEBUG}_OUTPUT

• `IntSetArray discreteDesignSetIntValues`
  values corresponding to discrete design integer set variable

• `RealSetArray discreteDesignSetRealValues`
  values corresponding to discrete design real set variable

• `Pecos::DistributionParams distParams`
  container for random variable distribution parameters

• `IntSetArray discreteStateSetIntValues`
  values corresponding to discrete state integer set variable

• `RealSetArray discreteStateSetRealValues`
  values corresponding to discrete state real set variable

• `RealVector primaryRespFnWts`
  multiobjective optimization or weighted least squares)

### Private Member Functions

• `Model * get_model (ProblemDescDB &problem_db)`
  Used by the envelope to instantiate the correct letter class.

• `int estimate_derivatives (const ShortArray &map_asv, const ShortArray &fd_grad_asv, const ShortArray &fd_hess_asv, const ShortArray &quasi_hess_asv, const ActiveSet &original_set, const bool asynch_asv)`
  method_source) in the numerical gradient specification.

• `void synchronize_derivatives (const Variables &vars, const IntResponseMap &fd_responses, Response &new_response, const ShortArray &fd_grad_asv, const ShortArray &fd_hess_asv, const ShortArray &quasi_hess_asv, const ActiveSet &original_set)`
  objects (fd_grad_responses) into a single response (new_response)

• `void update_response (const Variables &vars, Response &new_response, const ShortArray &fd_grad_asv, const ShortArray &fd_hess_asv, const ShortArray &quasi_hess_asv, const ActiveSet &original_set, Response &initial_map_response, const RealMatrix &new_fn_grads, const RealSymMatrixArray &new_fn_hessians)`
  overlay results to update a response object
• void update_quasi_hessians (const Variables &vars, Response &new_response, const ActiveSet &original_set)
  perform quasi-Newton Hessian updates

• bool manage_asv (const ShortArray &asv_in, ShortArray &map_asv_out, ShortArray &fd_grad_asv_out, ShortArray &fd_hess_asv_out, ShortArray &quasi_hess_asv_out)
  Coordinates usage of estimate_derivatives() calls based on asv_in.

Private Attributes

• String idModel
  model identifier string from the input file

• int modelEvalId
  evaluations are assimilated into a single higher level evaluation)

• bool estDerivsFlag
  asynch_compute_response()

• int evaluationCapacity
  capacity for concurrent evaluations supported by the Model

• std::map< int, ParConfigLIter > modelPCIterMap
  level as the lookup key

• bool initCommsBcastFlag
  init_communicators(); set from Strategy::init_iterator()

• bool modelAutoGraphicsFlag
  graphics posting at the strategy level)

• ModelList modelList
  used to collect sub-models for subordinate_models()

• VariablesList varsList
  synchronize().

• std::list< ShortArray > asvList
  asynch_compute_response() to synchronize()

• std::list< ActiveSet > setList
  asynch_compute_response() to synchronize()

• BoolList initialMapList
  synchronize_derivatives()
- **BoolList** `dbCaptureList`  
  `synchronize_derivatives()`

- **ResponseList** `dbResponseList`  
  `synchronize_derivatives()`

- **RealList** `deltaList`  
  transfers deltas from `estimate_derivatives()` to `synchronize_derivatives()`

- **IntIntMap** `numFDEvalsMap`  
  responses into numerical gradients.

- **IntIntMap** `rawEvalIdMap`  
  for rekeying `responseMap`.

- **RealVectorArray** `xPrev`  
  previous parameter vectors used in computing s for quasi-Newton updates

- **RealMatrix** `fnGradsPrev`  
  previous gradient vectors used in computing y for quasi-Newton updates

- **RealSymMatrixArray** `quasiHessians`  
  quasi-Newton Hessian approximations

- **SizetArray** `numQuasiUpdates`  
  number of quasi-Newton Hessian updates applied

- **IntResponseMap** `responseMap`  
  concatenated form. The similar map in `Interface` contains raw responses.

- **IntResponseMap** `graphicsRespMap`  
  to sequential input into the graphics

- **Model** `modelRep`  
  pointer to the letter (initialized only for the envelope)

- **int** `referenceCount`  
  number of objects sharing `modelRep`

### Classes

- **struct** `FDhelp`  
  possibly adjusted for bounds
8.60.1 Detailed Description

Base class for the model class hierarchy.

The Model class is the base class for one of the primary class hierarchies in DAKOTA. The model hierarchy contains a set of variables, an interface, and a set of responses, and an iterator operates on the model to map the variables into responses using the interface. For memory efficiency and enhanced polymorphism, the model hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (Model) serves as the envelope and one of the derived classes (selected in Model::get_model()) serves as the letter.

8.60.2 Constructor & Destructor Documentation

8.60.2.1 Model ()

default constructor

The default constructor is used in vector<Model> instantiations and for initialization of Model objects contained in Iterator and derived Strategy classes. modelRep is NULL in this case (a populated problem_db is needed to build a meaningful Model object). This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

8.60.2.2 Model (ProblemDescDB & problem_db)

standard constructor for envelope

Used in model instantiations within strategy constructors. Envelope constructor only needs to extract enough data to properly execute get_model, since Model(BaseConstructor, problem_db) builds the actual base class data for the derived models.

8.60.2.3 Model (const Model & model)

copy constructor

Copy constructor manages sharing of modelRep and incrementing of referenceCount.

8.60.2.4 ~Model () [virtual]

destructor

Destructor decrements referenceCount and only deletes modelRep when referenceCount reaches zero.

8.60.2.5 Model (BaseConstructor, ProblemDescDB & problem_db) [protected]

derived class constructors - Coplien, p. 139)

This constructor builds the base class data for all inherited models. get_model() instantiates a derived class and the derived class selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_model() again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Model).
8.60 Model Class Reference

8.60.2.6 Model (RecastBaseConstructor, ProblemDescDB & problem_db, ParallelLibrary & parallel_lib) [protected]

constructed on the fly

This constructor also builds the base class data for inherited models. However, it is used for recast models which are instantiated on the fly. Therefore it only initializes a small subset of attributes. Note that parallel_lib is managed separately from problem_db since parallel_lib is needed even in cases where problem_db is an empty envelope (i.e., use of dummy_db in Model(NoDBBaseConstructor) above.

8.60.3 Member Function Documentation

8.60.3.1 Model operator= (const Model & model)

assignment operator

8.60.3.2 Iterator & subordinate_iterator () [virtual]

return the sub-iterator in nested and surrogate models

return by reference requires use of dummy objects, but is important to allow use of assign_rep() since this operation must be performed on the original envelope object.

Reimplemented in DataFitSurrModel, NestedModel, and RecastModel.

8.60.3.3 Model & subordinate_model () [virtual]

dive through model recursions that may bypass some components.

return by reference requires use of dummy objects, but is important to allow use of assign_rep() since this operation must be performed on the original envelope object.

Reimplemented in NestedModel, RecastModel, and SurrogateModel.

8.60.3.4 Model & surrogate_model () [virtual]

return the approximation sub-model in surrogate models

return by reference requires use of dummy objects, but is important to allow use of assign_rep() since this operation must be performed on the original envelope object.

Reimplemented in DataFitSurrModel, HierarchSurrModel, and RecastModel.

8.60.3.5 Model & truth_model () [virtual]

return the truth sub-model in surrogate models
return by reference requires use of dummy objects, but is important to allow use of \texttt{assign\_rep()} since this operation must be performed on the original envelope object.

Reimplemented in \texttt{DataFitSurrModel}, \texttt{HierarchSurrModel}, and \texttt{RecastModel}.

\textbf{8.60.3.6} \texttt{void update\_from\_subordinate\_model (bool recurse\_flag = true) [virtual]}

propagate vars/labels/bounds/targets from the bottom up

used only for instantiate-on-the-fly model recursions (all \texttt{RecastModel} instantiations and alternate \texttt{DataFitSurrModel} instantiations). Single, Hierarchical, and Nested Models do not redefine the function since they do not support instantiate-on-the-fly. This means that the recursion will stop as soon as it encounters a \texttt{Model} that was instantiated normally, which is appropriate since ProblemDescDB-constructed Models use top-down information flow and do not require bottom-up updating.

Reimplemented in \texttt{DataFitSurrModel}, and \texttt{RecastModel}.

\textbf{8.60.3.7} \texttt{Interface & interface () [virtual]}

or \texttt{NestedModel::optionalInterface}

return by reference requires use of dummy objects, but is important to allow use of \texttt{assign\_rep()} since this operation must be performed on the original envelope object.

Reimplemented in \texttt{DataFitSurrModel}, \texttt{NestedModel}, \texttt{RecastModel}, and \texttt{SingleModel}.

\textbf{8.60.3.8} \texttt{String local\_eval\_synchronization () [virtual]}

return derived model synchronization setting

SingleModels and HierarchSurrModels redefine this virtual function. A default value of "synchronous" prevents asynch local operations for:

- NestedModels: a subIterator can support message passing parallelism, but not asynch local.
- DataFitSurrModels: while asynch evals on approximations will work due to some added bookkeeping, avoiding them is preferable.

Reimplemented in \texttt{RecastModel}, and \texttt{SingleModel}.

\textbf{8.60.3.9} \texttt{int local\_eval\_concurrency () [virtual]}

return derived model asynchronous evaluation concurrency

SingleModels and HierarchSurrModels redefine this virtual function.

Reimplemented in \texttt{RecastModel}, and \texttt{SingleModel}.

\textbf{8.60.3.10} \texttt{const String & interface\_id () const [virtual]}

return the interface identifier
return by reference requires use of dummy objects, but is important to allow use of assign_rep() since this operation must be performed on the original envelope object.

Reimplemented in DataFitSurrModel, NestedModel, RecastModel, and SingleModel.

8.60.3.11  ModelList & subordinate_models (bool recurse_flag = true)

return the sub-models in nested and surrogate models

since modelList is built with list insertions (using envelope copies), these models may not be used for model.assign_rep() since this operation must be performed on the original envelope object. They may, however, be used for letter-based operations (including assign_rep() on letter contents such as an interface).

8.60.3.12 void init_communicators (const int & max_iterator_concurrency, bool recurse_flag = true)

configuration in modelPCIterMap

The init_communicators() and derived_init_communicators() functions are structured to avoid performing the messageLengths estimation more than once. init_communicators() (not virtual) performs the estimation and then forwards the results to derived_init_communicators (virtual) which uses the data in different contexts.

8.60.3.13 void init_serial ()

modify some default settings to behave properly in serial.

The init_serial() and derived_init_serial() functions are structured to separate base class (common) operations from derived class (specialized) operations.

8.60.3.14 void estimate_message_lengths ()

estimate messageLengths for a model

This functionality has been pulled out of init_communicators() and defined separately so that it may be used in those cases when messageLengths is needed but model.init_communicators() is not called, e.g., for the master processor in the self-scheduling of a concurrent iterator strategy.

8.60.3.15 void assign_rep (Model * model_rep, bool ref_count_incr = true)

replaces existing letter with a new one

Similar to the assignment operator, the assign_rep() function decrements referenceCount for the old modelRep and assigns the new modelRep. It is different in that it is used for publishing derived class letters to existing envelopes, as opposed to sharing representations among multiple envelopes (in particular, assign_rep is passed a letter object and operator= is passed an envelope object). Letter assignment supports two models as governed by ref_count_incr:

- ref_count_incr = true (default): the incoming letter belongs to another envelope. In this case, increment the reference count in the normal manner so that deallocation of the letter is handled properly.
• ref_count_incr = false: the incoming letter is instantiated on the fly and has no envelope. This case is modeled after get_model(): a letter is dynamically allocated using new and passed into assign_rep, the letter’s reference count is not incremented, and the letter is not remotely deleted (its memory management is passed over to the envelope).

8.60.3.16 int derivative_concurrency () const

return the gradient concurrency for use in parallel configuration logic

This function assumes derivatives with respect to the active continuous variables. Therefore, concurrency with respect to the inactive continuous variables is not captured.

8.60.3.17 Real FDstep1 (FDhelp * fdh, Real h_mag, size_t j)

function returning finite-difference step size (affected by bounds)

Auxiliary function to compute forward or first central-difference step size.

8.60.3.18 Real FDstep2 (FDhelp * fdh, Real h, size_t j)

by bounds)

Auxiliary function to second central-difference step size, honoring bounds.

8.60.3.19 Model * get_model (ProblemDescDB & problem_db) [private]

Used by the envelope to instantiate the correct letter class.

Used only by the envelope constructor to initialize modelRep to the appropriate derived type, as given by the modelType attribute.

8.60.3.20 int estimate_derivatives (const ShortArray & map_asv, const ShortArray & fd_grad_asv, const ShortArray & fd_hess_asv, const ShortArray & quasi_hess_asv, const ActiveSet & original_set, const bool asynch_flag) [private]

method_source) in the numerical gradient specification.

Estimate derivatives by computing finite difference gradients, finite difference Hessians, and/or quasi-Newton Hessians. The total number of finite difference evaluations is returned for use by synchronize() to track response arrays, and it could be used to improve management of max_function_evaluations within the iterators.

! new logic

8.60.3.21 void synchronize_derivatives (const Variables & vars, const IntResponseMap & fd_responses, Response & new_response, const ShortArray & fd_grad_asv, const ShortArray & fd_hess_asv, const ShortArray & quasi_hess_asv, const ActiveSet & original_set) [private]

objects (fd_grad_responses) into a single response (new_response)
Merge an array of fd_responses into a single new_response. This function is used both by synchronous `compute_response()` for the case of asynchronous `estimate_derivatives()` and by `synchronize()` for the case where one or more `async_compute_response()` calls has employed asynchronous `estimate_derivatives()`.

8.60.3.22 `void update_response` (const `Variables` & `vars`, `Response` & `new_response`, const `ShortArray` & `fd_grad_asv`, const `ShortArray` & `fd_hess_asv`, const `ShortArray` & `quasi_hess_asv`, const `ActiveSet` & `original_set`, `Response` & `initial_map_response`, const `RealMatrix` & `new_fn_grads`, const `RealSymMatrixArray` & `new_fn_hessians`) [private]

Overlay results to update a response object.

Overlay the initial_map_response with numerically estimated new_fn_grads and new_fn_hessians to populate new_response as governed by asv vectors. Quasi-Newton secant Hessian updates are also performed here, since this is where the gradient data needed for the updates is first consolidated. Convenience function used by `estimate_derivatives()` for the synchronous case and by `synchronize_derivatives()` for the asynchronous case.

8.60.3.23 `void update_quasi_hessians` (const `Variables` & `vars`, `Response` & `new_response`, const `ActiveSet` & `original_set`) [private]

Perform quasi-Newton Hessian updates.

Quasi-Newton updates are performed for approximating response function Hessians using BFGS or SR1 formulations. These Hessians are supported only for the active continuous variables, and a check is performed on the DVV prior to invoking the function.

8.60.3.24 `bool manage_asv` (const `ShortArray` & `asv_in`, `ShortArray` & `map_asv_out`, `ShortArray` & `fd_grad_asv_out`, `ShortArray` & `fd_hess_asv_out`, `ShortArray` & `quasi_hess_asv_out`) [private]

Coordinates usage of `estimate_derivatives()` calls based on asv_in.

Splits asv_in total request into map_asv_out, fd_grad_asv_out, fd_hess_asv_out, and quasi_hess_asv_out as governed by the responses specification. If the returned use_est_deriv is true, then these asv outputs are used by `estimate_derivatives()` for the initial map, finite difference gradient evals, finite difference Hessian evals, and quasi-Hessian updates, respectively. If the returned use_est_deriv is false, then only map_asv_out is used.

8.62 MPIPackBuffer Class Reference

Class for packing MPI message buffers.

Public Member Functions

- **MPIPackBuffer** (int size_=1024)
  
  Constructor, which allows the default buffer size to be set.

- **~MPIPackBuffer** ()
  
  Destructor.

- **const char ∗buf ()**
  
  Returns a pointer to the internal buffer that has been packed.

- **int size ()**
  
  The number of bytes of packed data.

- **int capacity ()**
  
  The allocated size of Buffer.

- **void reset ()**
  
  Resets the buffer index in order to reuse the internal buffer.

- **void pack (const int ∗data, const int num=1)**
  
  Pack one or more int’s.

- **void pack (const u_int ∗data, const int num=1)**
  
  Pack one or more unsigned int’s.

- **void pack (const long ∗data, const int num=1)**
  
  Pack one or more long’s.

- **void pack (const u_long ∗data, const int num=1)**
  
  Pack one or more unsigned long’s.

- **void pack (const short ∗data, const int num=1)**
  
  Pack one or more short’s.

- **void pack (const u_short ∗data, const int num=1)**
  
  Pack one or more unsigned short’s.

- **void pack (const char ∗data, const int num=1)**
  
  Pack one or more char’s.
- void pack (const u_char *data, const int num=1)
  Pack one or more unsigned char’s.

- void pack (const double *data, const int num=1)
  Pack one or more double’s.

- void pack (const float *data, const int num=1)
  Pack one or more float’s.

- void pack (const bool *data, const int num=1)
  Pack one or more bool’s.

- void pack (const int &data)
  Pack a int.

- void pack (const u_int &data)
  Pack a unsigned int.

- void pack (const long &data)
  Pack a long.

- void pack (const u_long &data)
  Pack a unsigned long.

- void pack (const short &data)
  Pack a short.

- void pack (const u_short &data)
  Pack a unsigned short.

- void pack (const char &data)
  Pack a char.

- void pack (const u_char &data)
  Pack a unsigned char.

- void pack (const double &data)
  Pack a double.

- void pack (const float &data)
  Pack a float.

- void pack (const bool &data)
  Pack a bool.

#### 8.62.1 Detailed Description

Class for packing MPI message buffers.

A class that provides a facility for packing message buffers using the MPI_Pack facility. The `MPIPackBuffer` class dynamically resizes the internal buffer to contain enough memory to pack the entire object. When deleted, the `MPIPackBuffer` object deletes this internal buffer. This class is based on the Dakota_Version_3_0 version of `utilib::PackBuffer` from `utilib/src/io/PackBuf.[cpp,h]`

The documentation for this class was generated from the following files:

- `MPIPackBuffer.H`
- `MPIPackBuffer.C`
8.63 MPIUnpackBuffer Class Reference

Class for unpacking MPI message buffers.

Public Member Functions

- void setup (char *buf_, int size_, bool flag_=false)
  Method that does the setup for the constructors.

- MPIUnpackBuffer ()
  Default constructor.

- MPIUnpackBuffer (int size_)
  Constructor that specifies the size of the buffer.

- MPIUnpackBuffer (char *buf_, int size_, bool flag_=false)
  Constructor that sets the internal buffer to the given array.

- ~MPIUnpackBuffer ()
  Destructor.

- void resize (const int newsize)
  Resizes the internal buffer.

- const char * buf ()
  Returns a pointer to the internal buffer.

- int size ()
  Returns the length of the buffer.

- int curr ()
  Returns the number of bytes that have been unpacked from the buffer.

- void reset ()
  Resets the index of the internal buffer.

- void unpack (int *data, const int num=1)
  Unpack one or more int’s.

- void unpack (u_int *data, const int num=1)
  Unpack one or more unsigned int’s.

- void unpack (long *data, const int num=1)
  Unpack one or more long’s.

functions in order to avoid the need for static data
8.64 NCSUOptimizer Class Reference

8.64.1 Detailed Description

Wrapper class for the NCSU DIRECT optimization library.

The NCSUOptimizer class provides a wrapper for a Fortran 77 implementation of the DIRECT algorithm developed at North Carolina State University. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function or accessed through a static pointer.

The user input mappings are as follows:

8.64.2 Constructor & Destructor Documentation

8.64.2.1 NCSUOptimizer (Model & model)

standard constructor

This is the standard constructor with method specification support.

8.64.2.2 NCSUOptimizer (Model & model, const int & max_iter, const int & max_eval, double min_box_size = -1., double vol_box_size = -1., double solution_target = -DBL_MAX)

alternate constructor for instantiations "on the fly"

This is an alternate constructor for instantiations on the fly using a Model but no ProblemDescDB.

8.64.2.3 NCSUOptimizer (NoDBBaseConstructor, Model & model)

alternate constructor for Iterator instantiations by name

This is an alternate constructor for Iterator instantiations by name using a Model but no ProblemDescDB.

8.64.2.4 NCSUOptimizer (const RealVector & var_l_bnds, const RealVector & var_u_bnds, const int & max_iter, const int & max_eval, double(*)(const RealVector &x) user_obj_eval, double min_box_size = -1., double vol_box_size = -1., double solution_target = -DBL_MAX)

alternate constructor for instantiations "on the fly"

This is an alternate constructor for performing an optimization using the passed in objective function pointer.

The documentation for this class was generated from the following files:

- NCSUOptimizer.H
- NCSUOptimizer.C

  generic response terms.

• RealMatrix secondaryRespCoeffs
  contributions to the top-level inequality and equality constraints.
8.65 NestedModel Class Reference

8.65.1 Detailed Description

execution within every evaluation of the model.

The NestedModel class nests a sub-iterator execution within every model evaluation. This capability is most commonly used for optimization under uncertainty, in which a nondeterministic iterator is executed on every optimization function evaluation. The NestedModel also contains an optional interface, for portions of the model evaluation which are independent from the sub-iterator, and a set of mappings for combining sub-iterator and optional interface data into a top level response for the model.

8.65.2 Member Function Documentation

8.65.2.1 void derived_compute_response (const ActiveSet & set) [protected, virtual]

portion of compute_response() specific to NestedModel

Update subModel’s inactive variables with active variables from currentVariables, compute the optional interface and sub-iterator responses, and map these to the total model response.

Reimplemented from Model.

8.65.2.2 void derived_asynch_compute_response (const ActiveSet & set) [protected, virtual]

portion of asynch_compute_response() specific to NestedModel

Not currently supported by NestedModels (need to add concurrent iterator support). As a result, derived_synchronize() and derived_synchronize_nowait() are inactive as well.

Reimplemented from Model.

8.65.2.3 bool derived_master_overload () const [inline, protected, virtual]

evaluation (forwarded to optionalInterface)

Derived master overload for subModel is handled separately in subModel.compute_response() within sub-Iterator.run().

Reimplemented from Model.

8.65.2.4 void derived_init_communicators (const int & max_iterate_concurrency, bool recurse_flag = true) [inline, protected, virtual]

set up optionalInterface and subModel for parallel operations

Asynchronous flags need to be initialized for the subModel. In addition, max_iterate_concurrency is the outer level iterator concurrency, not the subIterator concurrency that subModel will see, and recomputing the message_lengths on the subModel is probably not a bad idea either. Therefore, recompute everything on subModel using init_communicators().

Reimplemented from Model.
8.65.2.5  int evaluation_id () const  [inline, protected, virtual]

Return the current evaluation id for the NestedModel.

return the top level nested evaluation count. To get the lower level eval count, the subModel must be explicitly
queried. This is consistent with the eval counter definitions in surrogate models.
Reimplemented from Model.

8.65.2.6  size_t cv_index_map (size_t cv_index)  [private]

offset cv_index to create index into aggregated primary/secondary arrays
maps index within active continuous variables to index within aggregated active continuous/discrete-int/discrete-
real variables.

8.65.2.7  size_t div_index_map (size_t div_index)  [private]

offset div_index to create index into aggregated primary/secondary arrays
maps index within active discrete int variables to index within aggregated active continuous/discrete-int/discrete-
real variables.

8.65.2.8  size_t drv_index_map (size_t drv_index)  [private]

offset drv_index to create index into aggregated primary/secondary arrays
maps index within active discrete real variables to index within aggregated active continuous/discrete-int/discrete-
real variables.

8.65.2.9  size_t ccv_index_map (size_t ccv_index)  [private]

continuous arrays
maps index within complement of active continuous variables to index within all continuous variables.

8.65.2.10  size_t cdv_index_map (size_t cdv_index)  [private]

discrete int arrays
maps index within complement of active discrete int variables to index within all discrete int variables.

8.65.2.11  size_t cdrv_index_map (size_t cdrv_index)  [private]

discrete real arrays
maps index within complement of active discrete real variables to index within all discrete real variables.
8.65.2.12  void response_mapping (const Response & opt_interface_response, const Response & sub_iterator_response, Response & mapped_response)  [private]

mappings to create the total response for the model

In the OOU case,

optionalInterface fns = {f}, {g} (deterministic primary functions, constraints)
subIterator fns = {S} (UQ response statistics)

Problem formulation for mapped functions:

\[
\begin{align*}
\text{minimize} & \quad {f} + [W]{S} \\
\text{subject to} & \quad {g}_l \leq {g} \leq {g}_u \\
& \quad {a}_l \leq [A]{S} \leq {a}_u \\
& \quad {g} = {g}_t \\
& \quad [A]{S} = {a}_t
\end{align*}
\]

where \([W]\) is the primary_mapping_matrix user input (primaryRespCoeffs class attribute), \([A]\) is the secondary_mapping_matrix user input (secondaryRespCoeffs class attribute), \([{g}_l], [{a}_l]\) are the top level inequality constraint lower bounds, \([{g}_u], [{a}_u]\) are the top level inequality constraint upper bounds, and \([{g}_t], [{a}_t]\) are the top level equality constraint targets.

NOTE: optionalInterface/subIterator primary fns (obj/lsq/generic fns) overlap but optionalInterface/subIterator secondary fns (ineq/eq constraints) do not. The \([W]\) matrix can be specified so as to allow

- some purely deterministic primary functions and some combined: \([W]\) filled and \([W].\text{num\_rows()} < \{f\}.\text{length()}\) [combined first] or \([W].\text{num\_rows()} == \{f\}.\text{length()}\) and \([W]\) contains rows of zeros [combined last]
- some combined and some purely stochastic primary functions: \([W]\) filled and \([W].\text{num\_rows()} > \{f\}.\text{length()}\)
- separate deterministic and stochastic primary functions: \([W].\text{num\_rows()} > \{f\}.\text{length()}\) and \([W]\) contains \{f\}.\text{length()} rows of zeros.

If the need arises, could change constraint definition to allow overlap as well: \({g}_l \leq {g} + [A]{S} \leq {g}_u\) with \([A]\) usage the same as for \([W]\) above.

In the UOO case, things are simpler, just compute statistics of each optimization response function: \([W] = [I], \{f\}/[g]/[A]\) are empty.

8.65.3  Member Data Documentation

8.65.3.1  Model subModel  [private]

the sub-model used in sub-iterator evaluations

There are no restrictions on subModel, so arbitrary nestings are possible. This is commonly used to support surrogate-based optimization under uncertainty by having NestedModels contain SurrogateModels and vice versa.

The documentation for this class was generated from the following files:

8.66.1 Detailed Description

The derived input file database utilizing the new IDR parser.

The NIDRProblemDescDB class is derived from ProblemDescDB for use by the NIDR parser in processing DAKOTA input file data. For information on modifying the NIDR input parsing procedures, refer to Dakota/docs/Dev_Spec_Change.dox. For more on the parsing technology, see "Specifying and Reading Program Input with NIDR" by David M. Gay (report SAND2008-2261P, which is available in PDF form as http://www.sandia.gov/~dmgay/nidr08.pdf). Source for the routines declared herein is NIDRProblemDescDB.C, in which most routines are so short that a description seems unnecessary.

8.66.2 Member Function Documentation

8.66.2.1 void derived_parse_inputs (const char * dakota_input_file, const char * parser_options)

### 8.68.1 Detailed Description

Wrapper class for the NL2SOL nonlinear least squares library.

The `NL2SOLLeastSq` class provides a wrapper for NL2SOL (TOMS Algorithm 573), in the updated form of Port Library routines `dn[fg][b ]` from Bell Labs; see [http://www.netlib.org/port/readme](http://www.netlib.org/port/readme). The Fortran from Port has been turned into C by f2c. NL2SOL uses a function pointer approach for which passed functions must be either global functions or static member functions.

The documentation for this class was generated from the following files:

- `NL2SOLLeastSq.H`
- `NL2SOLLeastSq.C`
8.69 NLPQLPOptimizer Class Reference

Wrapper class for the NLPQLP optimization library, Version 2.0.

  *performs run-time set up*

### Private Member Functions

- **void initialize ()**
  *Shared constructor code.*

- **void allocate_workspace ()**
  *Allocates workspace for the optimizer.*
• void deallocate_workspace ()
  Releases workspace memory.

• void allocate_constraints ()
  Allocates constraint mappings.

Private Attributes

• int L
  the serial version by setting L=1.

• int numEqConstraints
  numEqConstraints : Number of equality constraints.

• int MMAX
  MMAX must be at least one and greater or equal to M.

• int N
  N : Number of optimization variables.

• int NMAX
  than N.

• int MNN2
  MNN2 : Must be equal to M+N+N+2.

• double * X
  function values should be computed simultaneously.

• double * F
  values to be computed from L iterates stored in X.

• double * G
  function values to be computed from L iterates stored in X.

• double * DF
  of F to compute DF.

• double * DG
  has to be equal to MMAX.

• double * U
  inequality constraints should be nonnegative.
- double * C
to NMAX.
- double * D
array D.
- double ACC
  than the accuracy by which gradients are computed.
- double ACCQP
  by NLPQLP and subsequently multiplied by 1.0D+4.
- double STPMIN
  by STPMIN*(1/L-1). If STPMIN<=0, then STPMIN=ACC is used.
- int MAXFUN
  than 50.
- int MAXIT
  gradients (e.g. 100).
- int MAX_NM
  MAX_NM=0, monotone line search is performed.
- double TOL_NM
  non-negative (e.g. 0.1).
- int IPRINT
  values are displayed during the line search.
- int MODE
  function in C and D in form of an LDL decomposition.
- int IOUT
  write-statements start with 'WRITE(IOUT,... '
- int IFAIL
  constraint.
- double * WA
  WA(LWA) : WA is a real working array of length LWA.
- int LWA
  LWA : LWA value extracted from NLPQLP20.f.
- int * KWA
KWA(LKWA) : The user has to provide working space for an integer array.

- int LKWA
  LKWA : LKWA should be at least N+10.

- int ACTIVE
  ACTIVE(J)=.TRUE., J=1,...,M.

- int LACTIVE
  least 2*M+10.

- int LQL
  contains only an upper triangular factor.

- int numNlpqlConstr
  total number of constraints seen by NLPQL

- SizetList nonlinIneqConMappingIndices
  constraints used in computing the corresponding NLPQL constraints.

- RealList nonlinIneqConMappingMultipliers
  constraints to the corresponding NLPQL constraints.

- RealList nonlinIneqConMappingOffsets
  constraints to the corresponding NLPQL constraints.

- SizetList linIneqConMappingIndices
  constraints used in computing the corresponding NLPQL constraints.

- RealList linIneqConMappingMultipliers
  constraints to the corresponding NLPQL constraints.

- RealList linIneqConMappingOffsets
  constraints to the corresponding NLPQL constraints.

8.69.1 Detailed Description

Wrapper class for the NLPQLP optimization library, Version 2.0.

*****************************************************************************

AN IMPLEMENTATION OF A SEQUENTIAL QUADRATIC PROGRAMMING METHOD FOR SOLVING
NONLINEAR OPTIMIZATION PROBLEMS BY DISTRIBUTED COMPUTING AND NON-MONOTONE
LINE SEARCH

This subroutine solves the general nonlinear programming problem
minimize $F(X)$ subject to $G(J,X) = 0$, $J=1,...,ME$ $G(J,X) \geq 0$, $J=ME+1,...,M$ $XL \leq X \leq XU$

and is an extension of the code NLPQLD. NLPQLP is specifically tuned to run under distributed systems. A new input parameter $L$ is introduced for the number of parallel computers, that is the number of function calls to be executed simultaneously. In case of $L=1$, NLPQLP is identical to NLPQLD. Otherwise the line search is modified to allow $L$ parallel function calls in advance. Moreover the user has the opportunity to used distributed function calls for evaluating gradients.

The algorithm is a modification of the method of Wilson, Han, and Powell. In each iteration step, a linearly constrained quadratic programming problem is formulated by approximating the Lagrangian function quadratically and by linearizing the constraints. Subsequently, a one-dimensional line search is performed with respect to an augmented Lagrangian merit function to obtain a new iterate. Also the modified line search algorithm guarantees convergence under the same assumptions as before.

For the new version, a non-monotone line search is implemented which allows to increase the merit function in case of instabilities, for example caused by round-off errors, errors in gradient approximations, etc.

The subroutine contains the option to predetermine initial guesses for the multipliers or the Hessian of the Lagrangian function and is called by reverse communication.

The documentation for this class was generated from the following files:

- NLPQLPOptimizer.H
- NLPQLPOptimizer.C

8.70 NLSSOLLeastSq Class Reference

8.70.1 Detailed Description

Wrapper class for the NLSSOL nonlinear least squares library.

The NLSSOLLeastSq class provides a wrapper for NLSSOL, a Fortran 77 sequential quadratic programming library from Stanford University marketed by Stanford Business Associates. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any nonstatic attribute used within static member functions must be either local to that function or accessed through a static pointer.

The user input mappings are as follows: max_function_evaluations is implemented directly in NLSSOLLeastSq's evaluator functions since there is no NLSSOL parameter equivalent, and max_iterations, convergence_tolerance, output verbosity, verify_level, function_precision, and linesearch_tolerance are mapped into NLSSOL's "Major Iteration Limit", "Optimality Tolerance", "Major Print Level" (verbose: Major Print Level = 20; quiet: Major Print Level = 10), "Verify Level", "Function Precision", and "Linesearch Tolerance" parameters, respectively, using NLSSOL's npoptn() subroutine (as wrapped by npoptn2() from the npoptn_wrapper.f file). Refer to [Gill, P.E., Murray, W., Saunders, M.A., and Wright, M.H., 1986] for information on NLSSOL's optional input parameters and the npoptn() subroutine.

8.70.2 Constructor & Destructor Documentation

8.70.2.1 NLSSOLLeastSq (Model & model)

standard constructor

This is the primary constructor. It accepts a Model reference.

8.70.2.2 NLSSOLLeastSq (NoDBBaseConstructor, Model & model)

alternate constructor

This is an alternate constructor which accepts a Model but does not have a supporting method specification from the ProblemDescDB.

The documentation for this class was generated from the following files:

- NLSSOLLeastSq.H
- NLSSOLLeastSq.C
8.71 NoDBBaseConstructor Struct Reference

Dummy struct for overloading constructors used in on-the-fly instantiations.

Public Member Functions

- **NoDBBaseConstructor** (int=0)
  
  C++ structs can have constructors.

8.71.1 Detailed Description

Dummy struct for overloading constructors used in on-the-fly instantiations.

`NoDBBaseConstructor` is used to overload the constructor used for on-the-fly instantiations in which `ProblemDescDB` queries cannot be used. Putting this struct here avoids circular dependencies.

The documentation for this struct was generated from the following file:

- `global defs.h`
8.72 NonD Class Reference

Base class for all nondeterministic iterators (the DAKOTA/UQ branch).

  number of response functions

- `RealVectorArray requestedRespLevels`
  requested response levels for all response functions

- `RealVectorArray computedProbLevels`
  from `requestedRespLevels`

- `RealVectorArray computedRelLevels`
  from `requestedRespLevels`

- `RealVectorArray computedGenRelLevels`
  resulting from `requestedRespLevels`

- `short respLevelTarget`
  or `z -> beta* (GEN_RELIABILITIES)`

- `RealVectorArray requestedProbLevels`
  requested probability levels for all response functions

- `RealVectorArray requestedRelLevels`
requested reliability levels for all response functions

- RealVectorArray requestedGenRelLevels
  requested generalized reliability levels for all response functions

- RealVectorArray computedRespLevels
  requestedProbLevels, requestedRelLevels, or requestedGenRelLevels

- size_t totalLevelRequests
  requestedProbLevels, and requestedRelLevels

- bool cdfFlag
  cumulative/CDF (true) or complementary/CCDF (false)

- Response finalStatistics
  response means, standard deviations, and probabilities of failure

Static Protected Attributes

- static NonD * nondInstance
  functions in order to avoid the need for static data

Private Member Functions

- void distribute_levels (RealVectorArray &levels)
  response functions if a short-hand specification is employed.

Private Attributes

- bool distParamDerivs
  to standard random variables u using the chain rule df/dx dx/du.

8.72.1 Detailed Description

Base class for all nondeterministic iterators (the DAKOTA/UQ branch).
The base class for nondeterministic iterators consolidates uncertain variable data and probabilistic utilities for inherited classes.
8.72.2 Member Function Documentation

8.72.2.1 void initialize_random_variables (short u_space_type)

initialize natafTransform based on distribution data from iteratedModel
Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the Model variables are in x-space.

8.72.2.2 void initialize_random_variables (const Pecos::ProbabilityTransformation & transform)

alternate form: initialize natafTransform based on incoming data
This function is commonly used to publish transformation data when the Model variables are in a transformed space (e.g., u-space) and ProbabilityTransformation::ranVarTypes et al. may not be generated directly. This allows for the use of inverse transformations to return the transformed space variables to their original states.

8.72.2.3 void initialize_run () [inline, protected, virtual]

typically memory initialization; setting of instance pointers
Perform initialization phases of run sequence, like allocating memory and setting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s initialize_run(), typically _before_ performing its own implementation steps.
Reimplemented from Iterator.

8.72.2.4 void run () [inline, protected, virtual]

and may include pre/post steps in lieu of separate pre/post
Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.
Reimplemented from Iterator.

8.72.2.5 void finalize_run () [inline, protected, virtual]

deallocation and resetting of instance pointers
Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s finalize_run(), typically _after_ performing its own implementation steps.
Reimplemented from Iterator.

8.72.2.6 void initialize_final_statistics () [protected, virtual]

initializes finalStatistics for storing NonD final results
Default definition of virtual function (used by sampling, reliability, and polynomial chaos) defines the set of statistical results to include means, standard deviations, and level mappings.
Reimplemented in NonDInterval.

8.72.2.7  void initialize_random_variable_types (short u_space_type)  [protected]

initializes ranVarTypesX and ranVarTypesU within natafTransform
Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the Model variables are in x-space.

8.72.2.8  void initialize_random_variable_parameters ()  [protected]

ranVarUpperBndsX, and ranVarAddtlParamsX within natafTransform
Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the Model variables are in x-space.

8.72.2.9  void vars_u_to_x_mapping (const Variables & u_vars, Variables & x_vars)  [static, protected]

from NonD Iterators to x-space variables for Model evaluations.
Map the variables from iterator space (u) to simulation space (x).

8.72.2.10 void set_u_to_x_mapping (const ActiveSet & u_set, ActiveSet & x_set)  [static, protected]

from NonD Iterators to x-space ActiveSets for Model evaluations.
Define the DVV for x-space derivative evaluations by augmenting the iterator requests to account for correlations.

  initial probability to refine, and flags to control transformations

- void **initialize** (const RealVector &initial_point, int resp_fn, const Real &initial_prob, const Real &failure_threshold)
  initial probability to refine, and flags to control transformations

- const Real & **get_probability** ()
  returns the probability calculated by the importance sampling
Private Member Functions

- void `converge_c cov()`
  until coefficient of variation converges

- void `converge_probability()`
  until probability converges

- void `select_init_rep_points(const RealVectorArray &samples)`
  select representative points from initial set of samples

- void `select_rep_points(const RealVectorArray &samples)`
  select representative points from a set of samples

- void `calculate_rep_weights()`
  calculate relative weights of representative points

- void `generate_samples(RealVectorArray &samples)`
  generate a set of samples based on multimodal sampling density

- void `calculate_statistics(const RealVectorArray &samples, const size_t &total_sample_number, Real &probability_sum, Real &probability, Real &variance_sum, Real &coeff_of_variation)`
  the coefficient of variation (if requested)

Private Attributes

- short `importanceSamplingType`
  integration type (is, ais, mmais) provided by input specification

- bool `invertProb`
  flag for inversion of probability values using 1.-p

- size_t `numRepPoints`
  the number of representative points around which to sample

- size_t `respFn`
  the response function in the model to be sampled

- RealVectorArray `initPoints`
  the original set of samples passed into the MMAIS routine

- RealVectorArray `repPoints`
  the set of representative points around which to sample

- RealVector `repWeights`
8.73 NonDAdaptImpSampling Class Reference

the weight associated with each representative point

- RealVector designPoint
design point at which uncertain space is being sampled

- bool transInitPoints
initial points

- bool transPoints
before evaluation

- bool useModelBounds
flag to control if the sampler should respect the model bounds

- bool initLHS
flag to identify if initial points are generated from an LHS sample

- Real initProb
the initial probability (from FORM or SORM)

- Real finalProb
the final calculated probability (p)

- Real failThresh
the failure threshold (z-bar) for the problem.

8.73.1 Detailed Description

Class for the Adaptive Importance Sampling methods within DAKOTA.

The NonDAdaptImpSampling implements the multi-modal adaptive importance sampling used for reliability calculations. (eventually we will want to broaden this). Need to add more detail to this description.

8.73.2 Constructor & Destructor Documentation

8.73.2.1 NonDAdaptImpSampling (Model & model)

constructors standard constructor

This is the primary constructor. It accepts a Model reference.

8.73.2.2 NonDAdaptImpSampling (Model & model, const String & sample_type, int samples, int seed, const String & rng, short is_type, bool cdf_flag, bool x_space_data, bool x_space_model, bool bounded_model)

This is an alternate constructor for instantiations on the fly using a Model but no ProblemDescDB.
8.73.3 Member Function Documentation

8.73.3.1 void initialize (const RealVectorArray & initial_points, int resp_fn, const Real & initial_prob, const Real & failure_threshold)

Initializes data using a set of starting points.

8.73.3.2 void initialize (const RealVector & initial_point, int resp_fn, const Real & initial_prob, const Real & failure_threshold)

Initializes data using only one starting point.

The documentation for this class was generated from the following files:

  increment SSG level/TPQ order

- void increment_grid (const RealVector &dim_pref)
Private Member Functions

- void anisotropic_preference (const RealVector &dim_pref)
  update cubIntOrder based on an updated dimension preference

- void check_integration (const Pecos::ShortArray &u_types, const Pecos::DistributionParams &dp)
  verify self-consistency of integration specification

- void increment_reference ()
  increment each cubIntOrderRef entry by 1

Private Attributes

- Pecos::CubatureDriver * cubDriver
  convenience pointer to the numIntDriver representation

- unsigned short cubIntOrderRef
  any refinements posted by increment_grid()

- unsigned short cubIntRule
  the isotropic cubature integration rule

8.76.1 Detailed Description

numerical cubature points for evaluation of expectation integrals.

This class is used by NonDPolynomialChaos, but could also be used for general numerical integration of moments.

It employs Stroud cubature rules and extensions by D. Xiu.

8.76.2 Constructor & Destructor Documentation

8.76.2.1 NonDCubature (Model & model, const Pecos::ShortArray & u_types, unsigned short cub_int_order)

This alternate constructor is used for on-the-fly generation and evaluation of numerical cubature points.

8.76.2.2 NonDCubature (Model & model) [protected]

constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification. It is not currently used, as there is not yet a separate nond_cubature method specification.
8.76.3 Member Function Documentation

8.76.3.1 void sampling_reset (int min_samples, bool all_data_flag, bool stats_flag) [protected, virtual]

used by DataFitSurrModel::build_global() to publish the minimum number of points needed from the cubature routine in order to build a particular global approximation.

Reimplemented from Iterator.

8.76.3.2 void increment_grid (const RealVector & dim_pref) [inline, protected, virtual]

Should not be used, but pure virtual must be defined.

Implements NonDIIntegration.

8.76.3.3 void increment_reference () [inline, private]

increment each cubIntOrderRef entry by 1

cubIntOrderRef is a reference point for CubatureDriver::cubIntOrder, e.g., a lower bound

  print the final statistics

Protected Member Functions

- virtual void initialize_expansion ()
  initialize random variable definitions and final stats arrays

- virtual void compute_expansion ()
  form the expansion by calling uSpaceModel.build_approximation()

- virtual void print_coefficients (std::ostream &s)
  print expansion coefficients, as supported by derived instance

- virtual void print_moments (std::ostream &s)
• void update_expansion ()
  avoids unnecessary overhead in compute Expansion()

• void construct_g_u_model (Model &g_u_model)
  recast iteratedModel from x-space to u-space to create g_u_model

• void construct_cubature (Iterator &u_space_sampler, Model &g_u_model, unsigned short cub_int_order)
  assign a NonDCubature instance within u_space_sampler

• void construct_quadrature (Iterator &u_space_sampler, Model &g_u_model, const UShortArray &quad_order)
  assign a NonDQuadrature instance within u_space_sampler

• void construct_sparse_grid (Iterator &u_space_sampler, Model &g_u_model, unsigned short ssg_level, const RealVector &ssg_dim_pref)
  assign a NonDSparsegrid instance within u_space_sampler

• void construct_lhs (Iterator &u_space_sampler, Model &g_u_model)
  assign a NonDLHSSampling instance within u_space_sampler

• void initialize_u_space_model ()
  initialize uSpaceModel polynomial approximations with PCE/SC data

• void construct_expansion_sampler ()
  construct the expansionSampler operating on uSpaceModel

• void compute_statistics ()
  calculate analytic and numerical statistics from the expansion

• void update_final_statistics ()
  update finalStatistics

Protected Attributes

• Model uSpaceModel
  u-space recasting and orthogonal polynomial data fit recursions

• short expansionCoeffsApproach
  calculation of the expansion coefficients

• size_t numUncertainQuant
  number of invocations of quantify_uncertainty()
• int numSamplesOnModel
  number of truth samples performed on g_model to form the expansion

• int numSamplesOnExpansion
  expansion in order to estimate probabilities

• bool useDerivsFlag
  the stochastic expansion.

Private Member Functions

• void average_total_sobol (RealVector &avg_sobol)
  anisotropy indicator

• void average_decay_rates (RealVector &avg_decay)
  an anisotropy indicator

• void initialize_sets ()
  initialization of adaptive refinement using generalized sparse grids

• Real increment_sets ()
  perform an adaptive refinement increment using generalized sparse grids

• void finalize_sets ()
  finalization of adaptive refinement using generalized sparse grids

• Real compute_covariance_metric (const RealSymMatrix &resp_covar_ref)
  compute 2-norm of change in response covariance

• Real compute_final_statistics_metric (const RealVector &final_stats_ref)
  compute 2-norm of change in final statistics

• void compute_covariance ()
  calculate respCovariance

• void print_covariance (std::ostream &s)
  print respCovariance

• void print_sobol_indices (std::ostream &s)
  print global sensitivity indices

• void print_local_sensitivity (std::ostream &s)
  print local sensitivities evaluated at initialPtU

• void compute_print_increment_results ()
manage print of results following a refinement increment

- void compute_print_iteration_results (bool initialize)
  manage print of results following a refinement increment

- void compute_print_converged_results ()
  manage print of results following convergence of iterative refinement

Private Attributes

- short ruleNestingOverride
  user override of rule nesting: NO_OVERRIDE, NESTED, or NON_NESTED

- short stochExpRefineType
  ADAPTIVE_P_REFINEMENT.

- short stochExpRefineControl
  or GENERALIZED_SPARSE

- bool impSampling
  flag to use LHS sampling or MMAIS sampling on the expansion

- Iterator expansionSampler
  an LHS sampling instance, but AIS could also be used.

- Iterator importanceSampler
  generated by the expansionSampler using importance sampling

- RealVector initialPtU
  stores the initial variables data in u-space

- RealMatrix expGradsMeanX
  evaluated at the means (used as uncertainty importance metrics)

- RealSymMatrix respCovariance
  symmetric matrix of analytic response covariance

- bool expSampling
  on the expansion

- short vbdControl
  UNIVARIATE_VBD, or ALL_VBD.

- Real vbdDropTol
  tolerance for omitting output of small VBD indices
8.77 NonDExpansion Class Reference

8.77.1 Detailed Description

colocation (SC)

The NonDExpansion class provides a base class for methods that use polynomial expansions to approximate the effect of parameter uncertainties on response functions of interest.

8.77.2 Member Function Documentation

8.77.2.1 void compute_statistics () [protected]
calculate analytic and numerical statistics from the expansion
Calculate analytic and numerical statistics from the expansion and log results within final_stats for use in OUU.

8.77.2.2 Real compute_final_statistics_metric (const RealVector & final_stats_ref) [private]
compute 2-norm of change in final statistics
computes a "goal-oriented" refinement metric employing finalStatistics

8.77.3 Member Data Documentation

8.77.3.1 bool useDerivsFlag [protected]
the stochastic expansion.
This is part of the method specification since the instantiation of the global data fit surrogate is implicit with no user specification. This behavior is distinct from the usage of response derivatives with respect to auxilliary variables (design, epistemic) for computing derivatives of aleatory expansion statistics with respect to these variables.
The documentation for this class was generated from the following files:

  post-process the interval computed for a response function

- **void post_process_final_results ()**
  
  perform final post-processing
8.78.1 Detailed Description

Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.

The NonDEvidence class implements the propagation of epistemic uncertainty using Dempster-Shafer theory of evidence. In this approach, one assigns a set of basic probability assignments (BPA) to intervals defined for the uncertain variables. Input interval combinations are calculated, along with their BPA. Currently, the response function is evaluated at a set of sample points, then a response surface is constructed which is sampled extensively to find the minimum and maximum within each input interval cell, corresponding to the belief and plausibility within that cell, respectively. This data is then aggregated to calculate cumulative distribution functions for belief and plausibility.

The documentation for this class was generated from the following files:

  functions in order to avoid the need for static data

8.79.1 Detailed Description

to calculate interval bounds for epistemic uncertainty quantification

The NonDGlobalInterval class supports global nongradient-based optimization approaches to determining interval bounds for epistemic UQ. The interval bounds may be on the entire function in the case of pure interval analysis (e.g., intervals on input = intervals on output), or the intervals may be on statistics of an "inner loop" aleatory analysis such as intervals on means, variances, or percentile levels. The preliminary implementation will use a Gaussian process surrogate to determine interval bounds.

The documentation for this class was generated from the following files:

8.80.1 Detailed Description

Class for global reliability methods within DAKOTA/UQ.

The NonDGlobalReliability class implements EGO/SKO for global MPP search, which maximizes an expected improvement function derived from Gaussian process models. Once the limit state has been characterized, a multimodal importance sampling approach is used to compute probabilities.

The documentation for this class was generated from the following files:

- NonDGlobalReliability.H
- NonDGlobalReliability.C

8.81.1 Detailed Description

to calculate interval bounds for epistemic uncertainty quantification

The NonDGlobalSingleInterval class supports global nongradient-based optimization approaches to determining interval bounds for epistemic UQ. The interval bounds may be on the entire function in the case of pure interval analysis (e.g. intervals on input = intervals on output), or the intervals may be on statistics of an “inner loop” aleatory analysis such as intervals on means, variances, or percentile levels. The preliminary implementation will use a Gaussian process surrogate to determine interval bounds.

The documentation for this class was generated from the following files:

- NonDGlobalSingleInterval.H
- NonDGlobalSingleInterval.C

  print the final statistics

Private Attributes

- Iterator lhsSampler
  LHS sampling iterator.
- RealArray xObsData
  Storage for the observed x data (inputs) provided by the user.
- RealArray yObsData
  Storage for the observed y data (outputs) provided by the user.
- RealArray yStdData
  Storage for the observed standard deviations of y provided by the user.

8.82.1 Detailed Description

Generates posterior distribution on model parameters given experiment data.

This class provides a wrapper for the functionality provided in the Los Alamos National Laboratory code called GPM/SA (Gaussian Process Models for Simulation Analysis). Although this is a code that provides input/output mapping, it DOES NOT provide the mapping that we usually think of in the NonDeterministic class hierarchy in DAKOTA, where uncertainty in parameter inputs are mapped to uncertainty in simulation responses. Instead, this class takes a pre-existing set of simulation data as well as experimental data, and maps priors on input parameters to posterior distributions on those input parameters, according to a likelihood function. The goal of the MCMC sampling is to produce posterior values of parameter estimates which will produce simulation response values that "match well" to the experimental data. The MCMC is an integral part of the calibration. The data structures in GPM/SA are fairly detailed and nested. Part of this prototyping exercise is to determine what data structures need to be specified and initialized in DAKOTA and sent to GPM/SA, and what data structures will be returned.

8.82.2 Constructor & Destructor Documentation

8.82.2.1 NonDGPMSABayesCalibration (Model & model)

standard constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.
8.82.3 Member Function Documentation

8.82.3.1 void quantify_uncertainty () [protected, virtual]

additional variables to be specified here.

This method does all the pre-processing necessary to call the GPM/SA code, including running LHS on the
model to generate the initial samples, doing some normalization, calling the GPM/SA functions, and returning
the posterior parameter distributions.

Implements NonD.

The documentation for this class was generated from the following files:

8.83.1 Detailed Description

Performs incremental LHS sampling for uncertainty quantification.

The Latin Hypercube Sampling (LHS) package from Sandia Albuquerque’s Risk and Reliability organization provides comprehensive capabilities for Monte Carlo and Latin Hypercube sampling within a broad array of user-specified probabilistic parameter distributions. The incremental LHS sampling capability allows one to supplement an initial sample of size n to size 2n while maintaining the correct stratification of the 2n samples and also maintaining the specified correlation structure. The incremental version of LHS will return a sample of size n, which when combined with the original sample of size n, allows one to double the size of the sample.

8.83.2 Constructor & Destructor Documentation

8.83.2.1 NonDIncremLHSSampling (Model & model)

constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.

8.85.1 Detailed Description

Base class for interval-based methods within DAKOTA/UQ.

The NonDInterval class implements the propagation of epistemic uncertainty using either pure interval propagation or Dempster-Shafer theory of evidence. In the latter approach, one assigns a set of basic probability assignments (BPA) to intervals defined for the uncertain variables. Input interval combinations are calculated,
along with their BPA. Currently, the response function is evaluated at a set of sample points, then a response surface is constructed which is sampled extensively to find the minimum and maximum within each input interval cell, corresponding to the belief and plausibility within that cell, respectively. This data is then aggregated to calculate cumulative distribution functions for belief and plausibility.

The documentation for this class was generated from the following files:

8.88.1 Detailed Description

Performs LHS and Monte Carlo sampling for uncertainty quantification.

The Latin Hypercube Sampling (LHS) package from Sandia Albuquerque’s Risk and Reliability organization provides comprehensive capabilities for Monte Carlo and Latin Hypercube sampling within a broad array of user-specified probabilistic parameter distributions. It enforces user-specified rank correlations through use of a mixing routine. The NonDLHSSampling class provides a C++ wrapper for the LHS library and is used for performing forward propagations of parameter uncertainties into response statistics.

8.88.2 Constructor & Destructor Documentation

8.88.2.1 NonDLHSSampling (Model & model)

standard constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.

8.88.2.2 NonDLHSSampling (Model & model, const String & sample_type, int samples, int seed, const String & rng, short sampling_vars_mode = ACTIVE)

alternate constructor for sample generation and evaluation "on the fly"

This alternate constructor is used for generation and evaluation of Model-based sample sets. A set_db_list_nodes has not been performed so required data must be passed through the constructor. It’s purpose is to avoid the need for a separate LHS specification within methods that use LHS sampling.

8.88.2.3 NonDLHSSampling (const String & sample_type, int samples, int seed, const String & rng, const RealVector & lower_bnds, const RealVector & upper_bnds)

alternate constructor for sample generation "on the fly"
This alternate constructor is used by *ConcurrentStrategy* for generation of uniform, uncorrelated sample sets. It is _not_ a letter-envelope instantiation and a *set_db_list_nodes* has not been performed. It is called with all needed data passed through the constructor and is designed to allow more flexibility in variables set definition (i.e., relax connection to a variables specification and allow sampling over parameter sets such as multiobjective weights). In this case, a *Model* is not used and the object must only be used for sample generation (no evaluation).

8.91.1 Detailed Description

calculate interval bounds for epistemic uncertainty quantification

The NonDLocalInterval class supports local gradient-based optimization approaches to determining interval bounds for epistemic UQ. The interval bounds may be on the entire function in the case of pure interval analysis (e.g. intervals on input = intervals on output), or the intervals may be on statistics of an “inner loop” aleatory analysis such as intervals on means, variances, or percentile levels.

The documentation for this class was generated from the following files:

  probability corrections using Newton’s method (called by reliability(p))

- void principal_curvatures ()
  Compute the kappaU vector of principal curvatures from fnHessU.
Private Attributes

- RealVector `meanStats`  
  means of response functions (calculated in `initial_taylor_series()`)  

- RealVector `stdDevStats`  
  `initial_taylor_series()`)  

- RealVector `fnGradX`  
  evaluation  

- RealVector `fnGradU`  
  Jacobian dx/du.  

- RealSymMatrix `fnHessX`  
  evaluation  

- RealSymMatrix `fnHessU`  
  Jacobian dx/du.  

- RealVector `kappaU`  
  transformation of `fnHessU`  

- RealVector `fnValsMeanX`  
  response function values evaluated at mean x  

- RealMatrix `fnGradsMeanX`  
  response function gradients evaluated at mean x  

- RealSymMatrixArray `fnHessiansMeanX`  
  response function Hessians evaluated at mean x  

- RealVector `ranVarMeansU`  
  vector of means for all uncertain random variables in u-space  

- RealVector `initialPtU`  
  initial guess for MPP search in u-space  

- RealVector `mostProbPointX`  
  location of MPP in x-space  

- RealVector `mostProbPointU`  
  location of MPP in u-space  

- RealVectorArray `prevMPPULev0`  
  `initialPtU` within RBDO.
- **RealMatrix** `prevFnGradDLev0`  
  for level 0. Used for warm-starting `initialPtU` within RBDO.

- **RealMatrix** `prevFnGradULev0`  
  for level 0. Used for warm-starting `initialPtU` within RBDO.

- **RealVector** `prevICVars`  
  previous design vector. Used for warm-starting `initialPtU` within RBDO.

- **ShortArray** `prevCumASVLev0`  
  for warm-starting `initialPtU` within RBDO.

- **bool** `npsolFlag`  
  selection (NPSOL SQP or OPT++ NIP)

- **bool** `warmStartFlag`  
  flag indicating the use of warm starts

- **bool** `nipModeOverrideFlag`  
  flag indicating the use of move overrides within OPT++ NIP

- **bool** `curvatureDataAvailable`  
  `mostProbPointU`) is available for computing principal curvatures

- **short** `integrationOrder`  
  integration order (1 or 2) provided by integration specification

- **short** `secondOrderIntType`  
  type of second-order integration: Breitung, Hohenbichler-Rackwitz, or Hong

- **Real** `curvatureThresh`  
  cut-off value for 1/sqrt() term in second-order probability corrections.

- **short** `taylorOrder`  
  derived from `hessianType`

- **RealMatrix** `impFactor`  
  importance factors predicted by MV

- **int** `npsolDerivLevel`  
  `fn, 2 = analytic grads of constraints, 3 = analytic grads of both`.

- **unsigned short** `warningBits`  
  set of warnings accumulated during execution
8.92 NonDLocalReliability Class Reference

8.92.1 Detailed Description

Class for the reliability methods within DAKOTA/UQ.

The NonDLocalReliability class implements the following reliability methods through the support of different limit state approximation and integration options: mean value (MVFO/SM/MVSOSM), advanced mean value method (AMV, AMV^2) in x- or u-space, iterated advanced mean value method (AMV, AMV^2) in x- or u-space, two-point adaptive nonlinearity approximation (TANA) in x- or u-space, first order reliability method (FORM), and second order reliability method (SORM). All options except mean value employ an optimizer (currently NPSOL SQP or OPT++ NIP) to solve an equality-constrained optimization problem for the most probable point (MPP). The MPP search may be formulated as the reliability index approach (RIA) for mapping response levels to reliabilities/probabilities or as the performance measure approach (PMA) for performing the inverse mapping of reliability/probability levels to response levels.

8.92.2 Member Function Documentation

8.92.2.1 void initial_taylor_series () [private]

Taylor-series approximation.

An initial first- or second-order Taylor-series approximation is required for MV/AMV/AMV+/TANA or for the case where meanStats or stdDevStats (from MV) are required within finalStatistics for subIterator usage of NonDLocalReliability.

8.92.2.2 void initialize_class_data () [private]

convenience function for initializing class scope arrays

Initialize class-scope arrays and perform other start-up activities, such as evaluating median limit state responses.

8.92.2.3 void initialize_level_data () [private]

data for each response function prior to level 0

For a particular response function prior to the first z/p/beta level, initialize/warm-start optimizer initial guess (initialPtU), expansion point (mostProbPointX/U), and associated response data (computedRespLevel, fnGradX/U, and fnHessX/U).

8.92.2.4 void initialize_mpp_search_data () [private]

data for each z/p/beta level for each response function

For a particular response function at a particular z/p/beta level, warm-start or reset the optimizer initial guess (initialPtU), expansion point (mostProbPointX/U), and associated response data (computedRespLevel, fnGradX/U, and fnHessX/U).
8.92.2.5 void update_mpp_search_data (const Variables & vars_star, const Response & resp_star) [private]

z/p/beta level for each response function
Includes case-specific logic for updating MPP search data for the AMV/AMV+/TANA/NO_APPROX methods.

8.92.2.6 void update_level_data () [private]

statistics following MPP convergence
Updates computedRespLevels/computedProbLevels/computedRelLevels, finalStatistics, warm start, and graphics data.

8.92.2.7 void update_pma_reliability_level () [private, virtual]

generalized reliabilities by inverting second-order integrations
For PMA SORM with prescribed p-level or prescribed generalized beta-level, requestedCDFRelLevel must be updated. This virtual function redefinition is called from NonDReliability::PMA_constraint_eval().
Reimplemented from NonDReliability.

8.92.2.8 void dg_ds_eval (const RealVector & x_vars, const RealVector & fn_grad_x, RealVector & final_stat_grad) [private]

convenience function for evaluating dg/ds
Computes dg/ds where s = design variables. Supports potentially overlapping cases of design variable augmentation and insertion.

8.92.2.9 Real probability (const Real & beta, bool cdf_flag) [private]

second-order integration
Converts beta into a probability using either first-order (FORM) or second-order (SORM) integration. The SORM calculation first calculates the principal curvatures at the MPP (using the approach in Ch. 8 of Haldar & Mahadevan), and then applies correction formulations from the literature (Breitung, Hohenbichler-Rackwitz, or Hong).

8.92.2.10 Real reliability (const Real & p, bool cdf_flag) [private]

second-order integration
Converts a probability into a reliability using the inverse of the first-order or second-order integrations implemented in NonDLocalReliability::probability().

8.93 NonDLocalSingleInterval Class Reference

8.93.1 Detailed Description

calculate interval bounds for epistemic uncertainty quantification

The NonDLocalSingleInterval class supports local gradient-based optimization approaches to determining interval bounds for epistemic UQ. The interval bounds may be on the entire function in the case of pure interval analysis (e.g. intervals on input = intervals on output), or the intervals may be on statistics of an "inner loop" aleatory analysis such as intervals on means, variances, or percentile levels.

8.94.1 Detailed Description

quantification

The NonDPolynomialChaos class uses a polynomial chaos expansion (PCE) approach to approximate the effect of parameter uncertainties on response functions of interest. It utilizes the OrthogPolyApproximation class to manage multiple types of orthogonal polynomials within a Wiener-Askey scheme to PCE. It supports PCE coefficient estimation via sampling, quadrature, point-collocation, and file import.

The documentation for this class was generated from the following files:

Private Attributes

- Pecos::TensorProductDriver * tpqDriver
  convenience pointer to the numIntDriver representation

- bool nestedRules
  quadrature rules such as Gauss-Patterson

- UShortArray quadOrderSpec
  the user specification for the number of Gauss points per dimension

- UShortArray quadOrderRef
  any refinements posted by increment_grid()

8.95.1 Detailed Description

normals/uniforms/exponentials/betas/gammas.
This class is used by NonDPolynomialChaos, but could also be used for general numerical integration of moments. It employs Gauss-Hermite, Gauss-Legendre, Gauss-Laguerre, Gauss-Jacobi and generalized Gauss-Laguerre quadrature for use with normal, uniform, exponential, beta, and gamma density functions and integration bounds. The abscissas and weights for one-dimensional integration are extracted from the appropriate OrthogonalPolynomial class and are extended to n-dimensions using a tensor product approach.

### 8.95.2 Constructor & Destructor Documentation

#### 8.95.2.1 NonDQuadrature (Model & model, const Pecos::ShortArray & u_types, const UShortArray & order, bool nested_rules = false)

This alternate constructor is used for on-the-fly generation and evaluation of numerical quadrature points.

#### 8.95.2.2 NonDQuadrature (Model & model) [protected]

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification. It is not currently used, as there is not yet a separate nond_quadrature method specification.

### 8.95.3 Member Function Documentation

#### 8.95.3.1 void sampling_reset (int min_samples, bool all_data_flag, bool stats_flag) [protected, virtual]

used by DataFitSurfModel::build_global() to publish the minimum number of points needed from the quadrature routine in order to build a particular global approximation.

Reimplemented from Iterator.

  beta-bar constraint target update is required for second-order PMA

Protected Attributes

- Model uSpaceModel
  recastings and data fits

- Model mppModel
  RecastModel which formulates the optimization subproblem: RIA, PMA, EGO.

- Iterator mppOptimizer
  Iterator which optimizes the mppModel.

- short mppSearchType
  $x/u$-space TANA, $x/u$-space EGO, or NO\_APPROX

- Iterator importanceSampler
  importance sampling instance used to compute/refine probabilities

- short integrationRefinement
  provided by refinement specification

- size\_t numRelAnalyses
  number of invocations of quantify\_uncertainty()

- size\_t approxIters
  number of approximation cycles for the current respFnCount/levelCount

- bool approxConverged
  indicates convergence of approximation-based iterations

- int respFnCount
  counter for which response function is being analyzed

- size\_t levelCount
  counter for which response/probability level is being analyzed

- size\_t statCount
counter for which final statistic is being computed

- Real requestedRespLevel
  the response level target for the current response function

- Real requestedCDFProbLevel
  the CDF probability level target for the current response function

- Real requestedCDFRelLevel
  the CDF reliability level target for the current response function

- Real computedRespLevel
  output response level calculated

- Real computedRelLevel
  output reliability level calculated

Static Protected Attributes

- static NonDReliability * nondRelInstance
  functions in order to avoid the need for static data

8.97.1 Detailed Description

Base class for the reliability methods within DAKOTA/UQ.

The NonDReliability class provides a base class for NonDLocalReliability, which implements traditional MPP-based reliability methods, and NonDGlobalReliability, which implements global limit state search using Gaussian process models in combination with multimodal importance sampling.

8.97.2 Member Function Documentation

8.97.2.1 void RIA_objective_eval (const Variables & sub_model_vars, const Variables & recast_vars, const Response & sub_model_response, Response & recast_response) [static, protected]

(MPP) with the objective function of \((\text{norm } u)^2\).

This function recasts a G(u) response set (already transformed and approximated in other recursions) into an RIA objective function.
8.97.2.2 void RIA_constraint_eval (const Variables & sub_model_vars, const Variables & recast_vars, const Response & sub_model_response, Response & recast_response) [static, protected]

(MPP) with the constraint of $G(u) = \text{response level}$. This function recasts a $G(u)$ response set (already transformed and approximated in other recursions) into an RIA equality constraint.

8.97.2.3 void PMA_objective_eval (const Variables & sub_model_vars, const Variables & recast_vars, const Response & sub_model_response, Response & recast_response) [static, protected]

(MPP) with the objective function of $G(u)$. This function recasts a $G(u)$ response set (already transformed and approximated in other recursions) into an PMA objective function.

8.97.2.4 void PMA_constraint_eval (const Variables & sub_model_vars, const Variables & recast_vars, const Response & sub_model_response, Response & recast_response) [static, protected]

(MPP) with the constraint of $(\text{norm } u)^2 = \beta^2$. This function recasts a $G(u)$ response set (already transformed and approximated in other recursions) into a PMA equality constraint.

  alternate constructor for sample generation and evaluation "on the fly"

- **NonDSampling** (NoDBBaseConstructor, const String &sample_type, int samples, int seed, const String &rng, const RealVector &lower_bnds, const RealVector &upper_bnds)
  alternate constructor for sample generation "on the fly"

- **~NonDSampling** ()
  destructor
• **int num_samples () const**
  get the current number of samples

• **void sampling_reset (int min_samples, bool all_data_flag, bool stats_flag)**
  resets number of samples and sampling flags

• **const String & sampling_scheme () const**
  return sampleType: "lhs" or "random"

• **void vary_pattern (bool pattern_flag)**
  set varyPattern

• **void get_parameter_sets (Model &model)**
  distributions/bounds defined in the incoming model.

• **void get_parameter_sets (const RealVector &lower_bnds, const RealVector &upper_bnds)**
  lower_bnds/upper_bnds.

• **void update_model_from_sample (Model &model, const Real ∗ sample_vars)**
  Override default update of continuous vars only.

• **void initialize_lhs (bool write_message)**
  increments numLHSRuns, sets random seed, and initializes lhsDriver

• **void compute_statistics (const RealMatrix &vars_samples, const ResponseArray &resp_samples)**
  or intervals (epistemic or mixed uncertainties)

• **void compute_intervals (const ResponseArray &samples)**
  called by compute_statistics() to calculate min/max intervals

• **void compute_moments (const ResponseArray &samples)**
  deviations, and confidence intervals

• **void print_statistics (std::ostream &s) const**
  prints the statistics computed in compute_statistics()

• **void print_intervals (std::ostream &s) const**
  prints the intervals computed in compute_intervals()

• **void print_moments (std::ostream &s) const**
  prints the moments computed in compute_moments()

• **void view_counts (const Model &model, size_t &cv_start, size_t &num_cv, size_t &div_start, size_t &num_div, size_t &drv_start, size_t &num_drv) const**
  compute sampled subsets of all cv/div/drv from samplingVarsMode and model
Protected Attributes

- const int seedSpec
  the user seed specification (default is 0)

- int randomSeed
  the current seed

- const int samplesSpec
  initial specification of number of samples

- int numSamples
  the current number of samples to evaluate

- String rngName
  name of the random number generator

- String sampleType
  the sample type: random, lhs, or incremental_lhs

- Pecos::LHSDriver lhsDriver
  the C++ wrapper for the F90 LHS library

- bool statsFlag
  flags computation/output of statistics

- bool allDataFlag
  flags update of allResponses (allVariables or allSamples already defined)

- short samplingVarsMode
  the sampling mode: ACTIVE, ACTIVE_UNIFORM, ALL, or ALL_UNIFORM

- short sampleRanksMode
  SET_RANKS, or SET_GET_RANKS.

- bool varyPattern
  SBO/SBNLS) are not repeated, but are still repeatable.

- RealMatrix sampleRanks
  data structure to hold the sample ranks

- RealVector mean95CIDs
  intervals (calculated in compute_moments())

- RealVector stdDev95CILowerBnds
  (calculated in compute_moments())
• RealVector stdDev95CIUpperBnds
  (calculated in compute_moments())

• SensAnalysisGlobal nonDSampCorr
  initialize statistical post processing

Private Attributes

• size_t numLHSRuns
  counter for number of executions of get_parameter_sets() for this object

• RealVector meanStats
  means of response functions (calculated in compute_moments())

• RealVector stdDevStats
  std deviations of response functions (calculated in compute_moments())

• RealVector skewnessStats
  skewness of response functions (calculated in compute_moments())

• RealVector kurtosisStats
  kurtosis of response functions (calculated in compute_moments())

• RealVector minValues
  (calculated in compute_intervals())

• RealVector maxValues
  (calculated in compute_intervals())

8.98.1 Detailed Description

NonDIncremLHSSampling, and NonDAdaptImpSampling.

This base class provides common code for sampling methods which employ the Latin Hypercube Sampling (LHS) package from Sandia Albuquerque’s Risk and Reliability organization. NonDSampling now exclusively utilizes the 1998 Fortran 90 LHS version as documented in SAND98-0210, which was converted to a UNIX link library in 2001. The 1970’s vintage LHS (that had been f2c’d and converted to incomplete classes) has been removed.

8.98.2 Constructor & Destructor Documentation

8.98.2.1 NonDSampling (Model & model) [protected]

constructor
This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.

8.98.2.2 NonDSampling (NoDBBaseConstructor, Model & model, const String & sample_type, int samples, int seed, const String & rng) [protected]

alternate constructor for sample generation and evaluation "on the fly"
This alternate constructor is used for generation and evaluation of on-the-fly sample sets.

8.98.2.3 NonDSampling (NoDBBaseConstructor, const String & sample_type, int samples, int seed, const String & rng, const RealVector & lower_bnds, const RealVector & upper_bnds) [protected]

alternate constructor for sample generation "on the fly"
This alternate constructor is used by ConcurrentStrategy for generation of uniform, uncorrelated sample sets.

8.98.3 Member Function Documentation

8.98.3.1 int num_samples () const [inline, protected, virtual]

get the current number of samples
Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.
Reimplemented from Iterator.

8.98.3.2 void sampling_reset (int min_samples, bool all_data_flag, bool stats_flag) [inline, protected, virtual]

resets number of samples and sampling flags
used by DataFitSurrModel::build_global() to publish the minimum number of samples needed from the sampling routine (to build a particular global approximation) and to set allDataFlag and statsFlag. In this case, allDataFlag is set to true (vectors of variable and response sets must be returned to build the global approximation) and statsFlag is set to false (statistics computations are not needed).
Reimplemented from Iterator.

8.98.3.3 void get_parameter_sets (Model & model) [protected, virtual]

distributions/bounds defined in the incoming model.
This version of get_parameter_sets() extracts data from the user-defined model in any of the four sampling modes.
Reimplemented from Analyzer.
8.98.3.4  void get_parameter_sets (const RealVector & lower_bnds, const RealVector & upper_bnds)  
          [protected]

lower_bnds/upper_bnds.

This version of get_parameter_sets() does not extract data from the user-defined model, but instead relies on the incoming bounded region definition. It only support a UNIFORM sampling mode, where the distinction of ACTIVE_UNIFORM vs. ALL_UNIFORM is handled elsewhere.

  the user specification for the Smolyak sparse grid level
8.99 NonDSparseGrid Class Reference

- RealVector **dimPrefSpec**
  
  *the user specification for anisotropic dimension preference*

- unsigned short **ssgLevelRef**
  
  *maintained within ssgDriver*

8.99.1 Detailed Description

integrals over independent standard random variables.

This class is used by **NonDPolynomialChaos** and **NonDStochCollocation**, but could also be used for general numerical integration of moments. It employs 1-D Clenshaw-Curtis and Gaussian quadrature rules within Smolyak sparse grids.

8.99.2 Constructor & Destructor Documentation

8.99.2.1 **NonDSparseGrid**( Model & model, const Pecos::ShortArray & u_types, unsigned short ssg_level, const RealVector & dimPref, short refine_type = Pecos::NO_REFINEMENT, short refine_control = Pecos::GENERALIZED_SPARSE, bool track_ensemble_wts = true, bool nested_rules = true)

This alternate constructor is used for on-the-fly generation and evaluation of sparse grids within PCE and SC.

8.99.2.2 **NonDSparseGrid**( Model & model) [protected]

constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification. It is not currently used, as there is not a separate sparse_grid method specification.

8.99.3 Member Function Documentation

8.99.3.1 **void sampling_reset**( int min_samples, bool all_data_flag, bool stats_flag) [protected, virtual]

used by **DataFitSurrModel::build_global()** to publish the minimum number of points needed from the sparse grid routine in order to build a particular global approximation.

Reimplemented from **Iterator**.

The documentation for this class was generated from the following files:

- NonDSparseGrid.H
- NonDSparseGrid.C
8.100 NonDStochCollocation Class Reference

Inheritance diagram for NonDStochCollocation::

### Private Member Functions

- **void find_optimum_on_model ()**
called by find_optimum for setUpType == "model"

- void find_optimum_on_user_functions()
  called by find_optimum for setUpType == "user_functions"

Static Private Member Functions

- static void objective_eval (int &mode, int &n, double *x, double &f, double *gradf, int &nstate)
  objective function (passed by function pointer to NPSOL).

Private Attributes

- String setUpType
  NonDReliability currently uses the user_functions mode.

- RealVector initialPoint
  holds initial point passed in for "user_functions" mode.

- RealVector lowerBounds
  holds variable lower bounds passed in for "user_functions" mode.

- RealVector upperBounds
  holds variable upper bounds passed in for "user_functions" mode.

- void(* userObjectiveEval)(int &, int &, double *, double &, double *, int &)
  "user_functions" mode.

- void(* userConstraintEval)(int &, int &, int &, int &, int *, double *, double *, double *, int &)
  "user_functions" mode.

Static Private Attributes

- static NPSOLOptimizer * npsolInstance
  functions in order to avoid the need for static data

8.101.1 Detailed Description

Wrapper class for the NPSOL optimization library.

The NPSOLOptimizer class provides a wrapper for NPSOL, a Fortran 77 sequential quadratic programming library from Stanford University marketed by Stanford Business Associates. It uses a function pointer approach
for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function or accessed through a static pointer.

The user input mappings are as follows: max_function_evaluations is implemented directly in NPSOLOptimizer's evaluator functions since there is no NPSOL parameter equivalent, and max_iterations, convergence_tolerance, output verbosity, verify_level, function_precision, and linesearch_tolerance are mapped into NPSOL's "Major Iteration Limit", "Optimality Tolerance", "Major Print Level" (verbose: Major Print Level = 20; quiet: Major Print Level = 10), "Verify Level", "Function Precision", and "Linesearch Tolerance" parameters, respectively, using NPSOL's npoptn() subroutine (as wrapped by npoptn2() from the npoptn_wrapper.f file). Refer to [Gill, P.E., Murray, W., Saunders, M.A., and Wright, M.H., 1986] for information on NPSOL's optional input parameters and the npoptn() subroutine.

8.101.2 Constructor & Destructor Documentation

8.101.2.1 NPSOLOptimizer (Model & model)

standard constructor

This is the primary constructor. It accepts a Model reference.

8.101.2.2 NPSOLOptimizer (NoDBBaseConstructor, Model & model)

alternate constructor for Iterator instantiations by name

This is an alternate constructor which accepts a Model but does not have a supporting method specification from the ProblemDescDB.

8.101.2.3 NPSOLOptimizer (Model & model, const int & derivative_level, const Real & conv_tol)

alternate constructor for instantiations "on the fly"

This is an alternate constructor for instantiations on the fly using a Model but no ProblemDescDB.

8.101.2.4 NPSOLOptimizer (const RealVector & initial_point, const RealVector & var_lower_bnds, const RealVector & var_upper_bnds, const RealMatrix & lin_ineq_coeffs, const RealVector & lin_ineq_lower_bnds, const RealVector & lin_ineq_upper_bnds, const RealMatrix & lin_eq_coeffs, const RealVector & lin_eq_targets, const RealVector & nonlin_ineq_lower_bnds, const RealVector & nonlin_ineq_upper_bnds, const RealVector & nonlin_eq_targets, void(*)(int &), int &, double *, double &, double *, int &) user_obj_eval, void(*)(int &, int &, int &, int &, int, double *, double *, double *, int & user_con_eval, const int & derivative_level, const Real & conv_tol)

alternate constructor for instantiations "on the fly"

This is an alternate constructor for performing an optimization using the passed in objective function and constraint function pointers.

The documentation for this class was generated from the following files:

- NPSOLOptimizer.H
• NPSOL::Optimizer.C
8.102 Optimizer Class Reference

Base class for the optimizer branch of the iterator hierarchy.

  *from native (user) to iterator space*

8.102.1 Detailed Description

Base class for the optimizer branch of the iterator hierarchy.

The `Optimizer` class provides common data and functionality for `DOTOptimizer`, `CONMINOptimizer`, `NPSOLOptimizer`, `SNLLOptimizer`, `NLPQLPOptimizer`, `COLINOptimizer`, and `JEGAOptimizer`.

8.102.2 Constructor & Destructor Documentation

8.102.2.1 `Optimizer (Model & model)` [protected]

standard constructor

This constructor extracts the inherited data for the optimizer branch and performs sanity checking on gradient and constraint settings.

8.102.3 Member Function Documentation

8.102.3.1 `void initialize_run ()` [protected, virtual]

Implements portions of `initialize_run` specific to Optimizers. This function should be invoked (or reimplemented) by any derived implementations of `initialize_run()` (which would otherwise hide it).

Reimplemented from `Minimizer`.

Reimplemented in `CONMINOptimizer, DOTOptimizer, NLPQLPOptimizer, and SNLLOptimizer`.

8.102.3.2 `void run ()` [inline, protected, virtual]

and may include pre/post steps in lieu of separate pre/post
Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.
Reimplemented from Iterator.

8.102.3.3 **void post_run (std::ostream & s)** [protected, virtual]

Implements portions of post_run specific to Optimizers. This function should be invoked (or redefined) by any derived implementations of post_run() (which would otherwise hide it).
Reimplemented from Iterator.
Reimplemented in COLINOptimizer, and SNLLOptimizer.

8.102.3.4 **void finalize_run ()** [inline, protected, virtual]

deallocation and resetting of instance pointers
Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implimenting, a derived class must call its nearest parent’s finalize_run(), typically _after_ performing its own implementation steps.
Reimplemented from Minimizer.
Reimplemented in SNLLOptimizer.

8.102.3.5 **void print_results (std::ostream & s)** [protected, virtual]

Redefines default iterator results printing to include optimization results (objective functions and constraints).
Reimplemented from Iterator.

8.102.3.6 **void primary_resp_recast (const Variables & native_vars, const Variables & scaled_vars, const Response & native_response, Response & iterator_response)** [static, private]

from native (user) to iterator space
Objective function map from user/native space to iterator/scaled/combined space using a RecastModel. If resizing the response, copies the constraint (secondary) data from native_response too

8.102.3.7 **void weighted_sum (const Response & full_response, Response & reduced_response, const RealVector & multiobj_wts) const** [private]

weighted objective for single-objective optimizers
This function is responsible for the mapping of multiple objective functions into a single objective for publishing to single-objective optimizers. Used in DOTOptimizer, NPSOLOptimizer, SNLLOptimizer, and SGOPTApplication on every function evaluation. The simple weighting approach (using primaryRespFnWts) is the only technique supported currently. The weightings are used to scale function values, gradients, and Hessians as needed.
8.102.3.8  void multi_objective_retrieve (const Variables & vars, Response & response) const

from the solution of a single-objective optimizer

Retrieve a full multiobjective response based on the data returned by a single objective optimizer by performing a data_pairs search.

Friends

- class ParallelLibrary
  streamline implementation

8.103.1 Detailed Description

collectively identify a particular multilevel parallel configuration.

Rather than containing the multilevel parallel configuration directly, ParallelConfiguration instead provides a set of list iterators which point into a combined list of ParallelLevels. This approach allows different configurations to reuse ParallelLevels without copying them. A list of ParallelConfigurations is contained in ParallelLibrary (ParallelLibrary::parallelConfigurations).

The documentation for this class was generated from the following file:

- ParallelLibrary.H
8.104 ParallelDirectApplicInterface Class Reference

plug-ins using assign_rep().

  execute an analysis code portion of a direct evaluation invocation

8.104.1 Detailed Description

plug-ins using assign_rep().

The plug-in ParallelDirectApplicInterface resides in namespace SIM and uses a copy of textbook() to perform parallel parameter to response mappings. It may be activated by specifying the –with-plugin configure option, which activates the DAKOTA_PLUGIN macro in dakota_config.h used by main.C (which activates the plug-in code block within that file) and activates the PLUGIN_S declaration defined in Makefile.include and used in Makefile.source (which add this class to the build). Test input files should then use an analysis_driver of "plugin_textbook".

  matching receive for packed buffer bcast across an analysis communicator

• **void bcast_si (MPIUnpackBuffer &recv_buff)**  
  matching recv for packed buffer bcast across a strat-iterator intra comm

• **void barrier_w ()**  
  enforce MPI_Barrier on MPI_COMM_WORLD

• **void barrier_i ()**  
  enforce MPI_Barrier on an iterator communicator

• **void barrier_e ()**  
  enforce MPI_Barrier on an evaluation communicator

• **void barrier_a ()**  
  enforce MPI_Barrier on an analysis communicator

• **void reduce_sum_ea (double *local_vals, double *sum_vals, const int &num_vals)**  
  compute a sum over an eval-analysis intra-communicator using MPI_Reduce

• **void reduce_sum_a (double *local_vals, double *sum_vals, const int &num_vals)**  
  compute a sum over an analysis communicator using MPI_Reduce

• **void test (MPI_Request &request, int &test_flag, MPI_Status &status)**  
  test a nonblocking send/receive request for completion

• **void wait (MPI_Request &request, MPI_Status &status)**  
  wait for a nonblocking send/receive request to complete

• **void waitall (const int &num_recvs, MPI_Request *&recv_reqs)**  
  wait for all messages from a series of nonblocking receives

• **void waitsome (const int &num_sends, MPI_Request *&recv_requests, int &num_recvs, int *&index_array, MPI_Status *&status_array)**  
  but complete all that are available

• **void free (MPI_Request &request)**  
  free an MPI_Request

• **const int & world_size () const**  
  return worldSize

• **const int & world_rank () const**  
  return worldRank
• bool `mpirun_flag` () const
  
  return mpirunFlag

\section*{8.106.1 Detailed Description}

message passing within these levels.

The \texttt{ParallelLibrary} class encapsulates all of the details of performing message passing within multiple levels of parallelism. It provides functions for partitioning of levels according to user configuration input and functions for passing messages within and across MPI communicators for each of the parallelism levels. If support for other message-passing libraries beyond MPI becomes needed (PVM, ...), then \texttt{ParallelLibrary} would be promoted to a base class with virtual functions to encapsulate the library-specific syntax.

\section*{8.106.2 Constructor & Destructor Documentation}

\subsection*{8.106.2.1 \texttt{ParallelLibrary} (int \& argc, char **& argv)}

stand-alone mode constructor

This constructor is the one used by \texttt{main.C}. It calls MPI\texttt{\_Init} conditionally based on whether a parallel launch is detected.

\subsection*{8.106.2.2 \texttt{ParallelLibrary} ()}

default library mode constructor (assumes MPI\texttt{\_COMM\_WORLD})

This constructor provides a library mode default \texttt{ParallelLibrary}. It does not call MPI\texttt{\_Init}, but rather gathers data from MPI\texttt{\_COMM\_WORLD} if MPI\texttt{\_Init} has been called elsewhere.

\subsection*{8.106.2.3 \texttt{ParallelLibrary} (MPI\texttt{\_Comm} dakota\texttt{\_mpi\_comm})}

library mode constructor accepting communicator

This constructor provides a library mode \texttt{ParallelLibrary}, accepting an MPI communicator that might not be MPI\texttt{\_COMM\_WORLD}. It does not call MPI\texttt{\_Init}, but rather gathers data from dakota\texttt{\_mpi\_comm} if MPI\texttt{\_Init} has been called elsewhere.
8.106.2.4 **ParallelLibrary** (const std::string & *dummy*)

dummy constructor (used for dummy_lib)

This constructor is used for creation of the global dummy_lib object, which is used to satisfy initialization requirements when the real ParallelLibrary object is not available.

8.106.3 Member Function Documentation

8.106.3.1 **void specify_outputs_restart**(CommandLineHandler & *cmd_line_handler*)

inputs (normal mode)

On the rank 0 processor, get the -output, -error, -read_restart, and -write_restart filenames and the -stop_restart limit from the command line. Defaults for the filenames from the command line handler are NULL for the filenames except write which defaults to dakota.rst and 0 for read_restart_evals if no user specification. This information is Bcast from rank 0 to all iterator masters in manage_outputs_restart().

8.106.3.2 **void specify_outputs_restart**(const char * *clh_std_output_filename* = NULL, const char * *clh_std_error_filename* = NULL, const char * *clh_read_restart_filename* = NULL, const char * *clh_write_restart_filename* = NULL, int *stop_restart_evals* = 0, bool *pre_run_flag* = false)

inputs (library mode).

Rather than extracting from the command line, pass the std output, std error, read restart, and write restart filenames and the stop restart limit directly. This function only needs to be invoked to specify non-default values [defaults for the filenames are NULL (resulting in no output redirection, no restart read, and default restart write) and 0 for the stop restart limit (resulting in no restart read limit)].

8.106.3.3 **void manage_outputs_restart**(const ParallelLevel & *pl*)

manage output streams and restart file(s) (both modes)

If the user has specified the use of files for DAKOTA standard output and/or standard error, then bind these filenames to the Cout/Cerr macros. In addition, if concurrent iterators are to be used, create and tag multiple output streams in order to prevent jumbled output. Manage restart file(s) by processing any incoming evaluations from an old restart file and by setting up the binary output stream for new evaluations. Only master iterator processor(s) read & write restart information. This function must follow init_iterator_communicators so that restart can be managed properly for concurrent iterator strategies. In the case of concurrent iterators, each iterator has its own restart file tagged with iterator number.

8.106.3.4 **void close_streams**()

close streams, files, and any other services

Close streams associated with manage_outputs and manage_restart and terminate any additional services that may be active.
8.106.3.5  void increment_parallel_configuration ()  [inline]

add a new node to parallelConfigurations and increment currPCIter

Called from the ParallelLibrary ctor and from Model::init_communicators(). An increment is performed for each Model initialization except the first (which inherits the world and strategy-iterator parallel levels from the first partial configuration).

8.106.3.6  void init_communicators (const ParallelLevel & parent_pl, const int & num_servers, const int & procs_per_server, const int & max_concurrency, const int & asynch_local_concurrency, const String & default_config, const String & scheduling_override)  [private]

split a parent communicator into child server communicators

Split parent communicator into concurrent child server partitions as specified by the passed parameters. This constructs new child intra-communicators and parent-child inter-communicators. This function is called from the Strategy constructor for the concurrent iterator level and from ApplicationInterface::init_communicators() for the concurrent evaluation and concurrent analysis levels.

8.106.3.7  bool resolve_inputs (int & num_servers, int & procs_per_server, const int & avail_procs, int & proc_remainder, const int & max_concurrency, const int & capacity_multiplier, const String & default_config, const String & scheduling_override, bool print_rank)  [private]

resolve user inputs into a sensible partitioning scheme

This function is responsible for the "auto-configure" intelligence of DAKOTA. It resolves a variety of inputs and overrides into a sensible partitioning configuration for a particular parallelism level. It also handles the general case in which a user’s specification request does not divide out evenly with the number of available processors for the level. If num_servers & procs_per_server are both nondefault, then the former takes precedence.

  inequality operator

8.107.1 Detailed Description

evaluation id.

ParamResponsePair provides a container class for association of the input for a particular function evaluation (a variables object) with the output from this function evaluation (a response object), along with an evaluation identifier. This container defines the basic unit used in the data_pairs cache, in restart file operations, and in a variety of scheduling algorithm queues. With the advent of STL, replacement of arrays of this class with map<> and pair<> template constructs may be possible (using map<pair<int,String>, pair<Variables,Response>>, for example), assuming that deep copies, I/O, alternate constructors, etc., can be adequately addressed. Boost tuple<> may also be a candidate.

8.107.2 Constructor & Destructor Documentation

8.107.2.1 ParamResponsePair (const Variables & vars, const String & interface_id, const Response & response, bool deep_copy = false) [inline]

alternate constructor for temporaries

Uses of this constructor often employ the standard Variables and Response copy constructors to share representations since this constructor is commonly used for search_pairs (which are local instantiations that go out of scope prior to any changes to values; i.e., they are not used for history).

8.107.2.2 ParamResponsePair (const Variables & vars, const String & interface_id, const Response & response, const int eval_id, bool deep_copy = true) [inline]

standard constructor for history uses

Uses of this constructor often do not share representations since deep copies are used when history mechanisms (e.g., data_pairs and beforeSynchCorePRPQueue) are involved.

8.107.3 Member Function Documentation

8.107.3.1 void read (MPIUnpackBuffer & s) [inline]

read a ParamResponsePair object from a packed MPI buffer

idInterface is omitted since master processor retains interface ids and communicates asv and response data only with slaves.
8.107.3.2  void write (MPIPackBuffer & s) const  [inline]

write a ParamResponsePair object to a packed MPI buffer
idInterface is omitted since master processor retains interface ids and communicates asv and response data only with slaves.

8.107.4  Member Data Documentation

8.107.4.1  IntStringPair evalInterfaceIds  [private]

the evalInterfaceIds aggregate

the function evaluation identifier (assigned from ApplicationInterface::fnEvalId) is paired with the interface used
to generate the response object. Used in PRPCache id_vars_set_compare to prevent duplicate detection on results
from different interfaces. evalInterfaceIds belongs here rather than in Response since some Response objects
involve consolidation of several fn evals (e.g., Model::synchronize_derivatives()) that are not, in total, generated
by a single interface. The prPair, on the other hand, is used for storage of all low level fn evals that get evaluated
in ApplicationInterface::map().

  centered about an initial point

• void multidim_loop ()
  defined by a set of multidimensional partitions

• bool distribute_list_of_points (const RealVector &list_of_pts)
  and listDRVPoints

• bool distribute_step_vector (const RealVector &step_vector)
  distributes incoming step_vector among contStepVector and discStepVector

• void final_point_to_step_vector ()
  compute step vectors from finalPoint, initial points, and numSteps

• void distribute_partitions ()
  compute step vectors from variablePartitions and global bounds

• bool check_num_steps (int num_steps)
  perform error checks on numSteps

• bool check_final_point (const RealVector &final_pt)
  perform error checks on finalPoint

• bool check_steps_per_variable (const IntVector &steps_per_var)
  perform error checks on stepsPerVariable

• bool check_variable_partitions (const UShortArray &partitions)
  perform error checks on variablePartitions

• bool check_finite_bounds ()
  as required for computing partitions of finite ranges

• bool check_ranges_sets (int num_steps)
  sanity check for vector parameter study

• bool check_ranges_sets (const IntVector &steps)
  sanity check for centered parameter study

• bool check_sets (const IntVector &steps)
  sanity check for increments along int/real set dimensions

• int truncate (const Real &value) const
  cast Real to int and ensure no resulting change in value

• int integer_step (int range, int num_steps) const
check for integer remainder and return step

- int index_step (size_t start, size_t end, int num_steps) const
  check for out of bounds and index remainder and return step

- void write_ordered (std::ostream &s, const RealVector &c_vector, const IntVector &di_vector, const RealVector &dr_vector)
  reorder CV/DIV/DRV into standard output order

- void write_ordered (std::ostream &s, const RealVector &c_vector, const IntVector &d_vector)
  reorder CV/DV into standard output order

- void c_step (size_t c_index, int increment, Variables &vars)
  helper function for performing a continuous step in one variable

- void dri_step (size_t d_index, size_t di_index, int increment, Variables &vars)
  range variable

- void dsi_step (size_t d_index, size_t di_index, int increment, const IntSet &values, Variables &vars)
  helper function for performing a discrete step in an integer set variable

- void dsr_step (size_t d_index, size_t dr_index, int increment, const RealSet &values, Variables &vars)
  helper function for performing a discrete step in a real set variable

Private Attributes

- short pStudyType
  CENTERED, or MULTIDIM.

- size_t numEvals
  total number of parameter study evaluations computed from specification

- RealVectorArray listCVPoints
  array of continuous evaluation points for the list_parameter_study

- IntVectorArray listDIVPoints
  array of discrete int evaluation points for the list_parameter_study

- RealVectorArray listDRVPoints
  array of discrete real evaluation points for the list_parameter_study

- RealVector initialCVPoint
  the continuous starting point for vector and centered parameter studies

- IntVector initialDIVPoint
Class for vector, list, centered, and multidimensional parameter studies. The `ParamStudy` class contains several algorithms for performing parameter studies of different types. The vector parameter study steps along an n-dimensional vector from an arbitrary initial point to an arbitrary final point in a specified number of steps. The centered parameter study performs a number of plus and minus offsets in each coordinate direction around a center point. A multidimensional parameter study fills an n-dimensional hypercube based on bounds and a specified number of partitions for each dimension. And the list parameter study provides for a user specification of a list of points to evaluate, which allows general parameter investigations not fitting the structure of vector, centered, or multidimensional parameter studies.

8.108.2 Member Function Documentation

8.108.2.1 `void pre_run () [virtual]`

which can generate all `Variables` (parameter sets) a priori

pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s `pre_run()`, if implemented, typically _before_ performing its own implementation steps.

Reimplemented from `Iterator`. 
8.108.2.2 void post_run (std::ostream & s) [virtual]

perform final analysis phase in a standalone way

Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s post_run(), typically _after_ performing its own implementation steps.

Reimplemented from Iterator.

8.111.1 Detailed Description

Derived approximation class for global basis polynomials.

The PecosApproximation class provides a global approximation based on basis polynomials. This includes orthogonal polynomials used for polynomial chaos expansions and interpolation polynomials used for stochastic collocation.

The documentation for this class was generated from the following files:

- PecosApproximation.H
- PecosApproximation.C
8.112 ProblemDescDB Class Reference

The database containing information parsed from the DAKOTA input file.

  get a String out of the database based on an identifier string

• const Real & get_real (const String &entry_name) const
  get a Real out of the database based on an identifier string

• int get_int (const String &entry_name) const
  get an int out of the database based on an identifier string

• short get_short (const String &entry_name) const
  get a short out of the database based on an identifier string

• unsigned short get_ushort (const String &entry_name) const
  get an unsigned short out of the database based on an identifier string

• size_t get_sizet (const String &entry_name) const
  get a size_t out of the database based on an identifier string

• bool get_bool (const String &entry_name) const
  get a bool out of the database based on an identifier string

• void ** get_voidss (const String &entry_name) const
  for getting a void**, e.g., &dlLib

• void insert_node (const DataStrategy &data_strategy)
  set the DataStrategy object

• void insert_node (const DataMethod &data_method)
  add a DataMethod object to the dataMethodList

• void insert_node (const DataModel &data_model)
  add a DataModel object to the dataModelList

• void insert_node (DataVariables &data_variables)
  add a DataVariables object to the dataVariablesList

• void insert_node (DataInterface &data_interface)
  add a DataInterface object to the dataInterfaceList

• void insert_node (DataResponses &data_responses)
  add a DataResponses object to the dataResponsesList
• void set (const String &entry_name, const RealVector &rdv)
  set a RealVector within the database based on an identifier string

• void set (const String &entry_name, const IntVector &idv)
  set an IntVector within the database based on an identifier string

• void set (const String &entry_name, const RealSymMatrix &rsdm)
  set a RealMatrix within the database based on an identifier string

• void set (const String &entry_name, const RealVectorArray &rdva)
  identifier string

• void set (const String &entry_name, const StringArray &dsa)
  set a StringArray within the database based on an identifier string

• bool is_null () const
  function to check dbRep (does this envelope contain a letter)

Protected Member Functions

• ProblemDescDB (BaseConstructor, ParallelLibrary &parallel_lib)
  derived class constructors - Coplien, p. 139)

• virtual void derived_parse_inputs (const char *dakota_input_file, const char *parser_options)
  derived class specifics within parse_inputs()

  or insert_node()
• std::list<DataVariables> dataVariablesList
  variables_kwhandler() or insert_node()

• std::list<DataInterface> dataInterfaceList
  interface_kwhandler() or insert_node()

• std::list<DataResponses> dataResponsesList
  responses_kwhandler() or insert_node()

• size_t strategyCnt
  counter for strategy specifications used in check_input

Private Member Functions

• const Iterator & get_iterator (Model &model)
  retrieve an existing Iterator, if it exists, or instantiate a new one

• const Model & get_model ()
  retrieve an existing Model, if it exists, or instantiate a new one

• const Variables & get_variables ()
  retrieve an existing Variables, if it exists, or instantiate a new one

• const Interface & get_interface ()
  retrieve an existing Interface, if it exists, or instantiate a new one

• const Response & get_response (const Variables &vars)
  retrieve an existing Response, if it exists, or instantiate a new one

• ProblemDescDB * get_db (ParallelLibrary &parallel_lib)
  Used by the envelope constructor to instantiate the correct letter class.

• void send_db_buffer ()
  and dataResponsesList. Used by manage_inputs().

• void receive_db_buffer ()
  and dataResponsesList. Used by manage_inputs().

Private Attributes

• ParallelLibrary & parallelLib
  reference to the parallel_lib object passed from main
• std::list<DataMethod>::iterator dataMethodIter
  iterator identifying the active list node in dataMethodList

• std::list<DataModel>::iterator dataModelIter
  iterator identifying the active list node in dataModelList

• std::list<DataVariables>::iterator dataVariablesIter
  iterator identifying the active list node in dataVariablesList

• std::list<DataInterface>::iterator dataInterfaceIter
  iterator identifying the active list node in dataInterfaceList

• std::list<DataResponses>::iterator dataResponsesIter
  iterator identifying the active list node in dataResponsesList

• IteratorList iteratorList
  list of iterator objects, one for each method specification

• ModelList modelList
  list of model objects, one for each model specification

• VariablesList variablesList
  list of variables objects, one for each variables specification

• InterfaceList interfaceList
  list of interface objects, one for each interface specification

• ResponseList responseList
  list of response objects, one for each responses specification

• bool methodDBLocked
  prior to setting the list node for the active method specification

• bool modelDBLocked
  prior to setting the list node for the active model specification

• bool variablesDBLocked
  prior to setting the list node for the active variables specification

• bool interfaceDBLocked
  prior to setting the list node for the active interface specification

• bool responsesDBLocked
  prior to setting the list node for the active responses specification

• ProblemDescDB * dbRep
pointer to the letter (initialized only for the envelope)

- int referenceCount
  number of objects sharing dbRep

8.112.1 Detailed Description

The database containing information parsed from the DAKOTA input file.
The ProblemDescDB class is a database for DAKOTA input file data that is populated by a parser defined in a derived class. When the parser reads a complete keyword, it populates a data class object (DataStrategy, DataMethod, DataVariables, DataInterface, or DataResponses) and, for all cases except strategy, appends the object to a linked list (dataMethodList, dataVariablesList, dataInterfaceList, or dataResponsesList). No strategy linked list is used since only one strategy specification is allowed.

8.112.2 Constructor & Destructor Documentation

8.112.2.1 ProblemDescDB ()

default constructor
The default constructor: dbRep is NULL in this case. This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

8.112.2.2 ProblemDescDB (ParallelLibrary & parallel_lib)

standard constructor
This is the envelope constructor which uses problem_db to build a fully populated db object. It only needs to extract enough data to properly execute get_db(problem_db), since the constructor overloaded with BaseConstructor builds the actual base class data inherited by the derived classes.

8.112.2.3 ProblemDescDB (const ProblemDescDB & db)

copy constructor
Copy constructor manages sharing of dbRep and incrementing of referenceCount.

8.112.2.4 ~ProblemDescDB ()

destructor
Destructor decrements referenceCount and only deletes dbRep when referenceCount reaches zero.

8.112.2.5 ProblemDescDB (BaseConstructor, ParallelLibrary & parallel_lib) [protected]

derived class constructors - Coplien, p. 139)
This constructor is the one which must build the base class data for all derived classes. get_db() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_db() again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~ProblemDescDB).
8.112.3 Member Function Documentation

8.112.3.1 ProblemDescDB operator= (const ProblemDescDB & db)

Assignment operator

8.112.3.2 void manage_inputs (CommandLineHandler & cmd_line_handler)

normal API employed in main.C.
Manage command line inputs using the CommandLineHandler class and parse the input file.

8.112.3.3 void manage_inputs (const char ∗ dakota_input_file, const char ∗ parser_options = NULL, void(*)(void ∗) callback = NULL, void ∗ callback_data = NULL)

library_mode.C.
Parse the input file, broadcast it to all processors, and post-process the data on all processors.

8.112.3.4 void parse_inputs (const char ∗ dakota_input_file, const char ∗ parser_options = NULL, void(*)(void ∗) callback = NULL, void ∗ callback_data = NULL)

have been provided.
Parse the input file, execute the callback function (if present), and perform basic checks on keyword counts.

8.112.3.5 void post_process ()

variables/responses specification arrays. Used by manage_inputs().
When using library mode in a parallel application, post_process() should be called on all processors following broadcast() of a minimal problem specification.

8.112.3.6 ProblemDescDB ∗ get_db (ParallelLibrary & parallel_lib) [private]

Used by the envelope constructor to instantiate the correct letter class.
Initializes dbRep to the appropriate derived type. The standard derived class constructors are invoked.
The documentation for this class was generated from the following files:

- ProblemDescDB.H
- ProblemDescDB.C
8.113  PStudyDACE Class Reference

8.113.1 Detailed Description

design of experiments methods.
The PStudyDACE base class manages common data and functions, such as those involving the best solutions located during the parameter set evaluations or the printing of final results.

8.113.2 Member Function Documentation

8.113.2.1 void run () [inline, protected, virtual]

and may include pre/post steps in lieu of separate pre/post
Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.
Reimplemented from Iterator.

8.113.2.2 void print_results (std::ostream & s) [protected, virtual]

print the final iterator results
This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().
Reimplemented from Analyzer.
8.113.2.3  void volumetric_quality (int ndim, int num_samples, double * sample_points)  [protected]

Calculation of volumetric quality measures.
Calculation of volumetric quality measures developed by FSU.

sets varyPattern in derived classes that support it

void get_parameter_sets(Model &model)

Returns one block of samples (ndim * num_samples).

Private Member Functions

void enforce_input_rules()

enforce sanity checks/modifications for the user input specification

Private Attributes

int samplesSpec

initial specification of number of samples

int numSamples

current number of samples to be evaluated

const UShortArray & varPartitionsSpec

number of partitions in each variable direction

int numPartitions

number of partitions to pass to PSUADE (levels = partitions + 1)

bool allDataFlag

Iterator::all_variables() and Iterator::all_responses().

size_t numDACERuns

counter for number of run() executions for this object

bool varyPattern

but are still repeatable

const int seedSpec

(allows repeatable results)

int randomSeed

current seed for the random number generator
8.114 **PSUADEDesignCompExp Class Reference**

8.114.1 **Detailed Description**

Wrapper class for the PSUADE library.

The `PSUADEDesignCompExp` class provides a wrapper for PSUADE, a C++ design of experiments library from Lawrence Livermore National Laboratory. Currently this class only includes the PSUADE Morris One-at-a-time (MOAT) method to uniformly sample the parameter space spanned by the active bounds of the current Model. It returns all generated samples and their corresponding responses as well as the best sample found.

8.114.2 **Constructor & Destructor Documentation**

8.114.2.1 `PSUADEDesignCompExp (Model & model)`

primary constructor for building a standard DACE iterator

This constructor is called for a standard iterator built with data from probDescDB.

8.114.3 **Member Function Documentation**

8.114.3.1 `void pre_run () [virtual]`

which can generate all Variables (parameter sets) a priori

pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s `pre_run()`, if implemented, typically _before_ performing its own implementation steps.

Reimplemented from `Iterator`.

8.114.3.2 `void post_run (std::ostream & s) [virtual]`

perform final analysis phase in a standalone way

Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s `post_run()`, typically _after_ performing its own implementation steps.

Reimplemented from `Iterator`.

8.114.3.3 `int num_samples () const [inline, virtual]`

get the current number of samples

Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxConcurrency. May be (is) overridden by derived classes.

Reimplemented from `Iterator`.

DAKOTA Version 5.1 Developers Manual generated on January 21, 2011
8.114.3.4  void enforce_input_rules ()  [private]

enforce sanity checks/modifications for the user input specification

Users may input a variety of quantities, but this function must enforce any restrictions imposed by the sampling algorithms.

The documentation for this class was generated from the following files:

- PSUADEDesignCompExp.H
- PSUADEDesignCompExp.C
8.115  RecastBaseConstructor Struct Reference

instantiations.

• bool build_approximation (const Variables &vars, const Response &response)
  builds the subModel approximation

• void update_approximation (bool rebuild_flag)
  replaces data in the subModel approximation

• void update_approximation (const Variables &vars, const Response &response, bool rebuild_flag)
  replaces data in the subModel approximation

• void update_approximation (const VariablesArray &vars_array, const ResponseArray &resp_array, bool rebuild_flag)
  replaces data in the subModel approximation

• void append_approximation (bool rebuild_flag)
  appends data to the subModel approximation

• void append_approximation (const Variables &vars, const Response &response, bool rebuild_flag)
  appends data to the subModel approximation

• void append_approximation (const VariablesArray &vars_array, const ResponseArray &resp_array, bool rebuild_flag)
  appends data to the subModel approximation

• void pop_approximation (bool save_sdp_set)
  of SurrogateDataPoint set for use in restore_approximation()

• void restore_approximation ()
  restore a previous approximation data state within a surrogate

• bool restore_available ()
  query for whether a trial increment is restorable within a surrogate

• void finalize_approximation ()
  finalize an approximation by applying all previous trial increments

• std::vector< Approximation > & approximations ()
  retrieve the set of Approximations from the subModel

• const RealVectorArray & approximation_coefficients ()
  retrieve the approximation coefficients from the subModel

• void approximation_coefficients (const RealVectorArray &approx(coeffs))
  set the approximation coefficients within the subModel

• const RealVector & approximation_variances (const RealVector &cvars)
retrieve the approximation variances from the subModel

- `const SDPList & approximation_data(size_t index)`
  retrieve the approximation data from the subModel

- `void component_parallel_mode(short mode)`
  virtual function redefinition is simply a sanity check.

- `String local_eval_synchronization()`
  return subModel local synchronization setting

- `int local_eval_concurrency()`
  return subModel local evaluation concurrency

- `bool derived_master_overload() const`
  evaluation (request forwarded to subModel)

- `void derived_init_communicators(const int &max_iterator_concurrency, bool recurse_flag=true)`
  set up RecastModel for parallel operations (request forwarded to subModel)

- `void derived_init_serial()`
  set up RecastModel for serial operations (request forwarded to subModel).

- `void derived_set_communicators(const int &max_iterator_concurrency, bool recurse_flag=true)`
  set active parallel configuration within subModel

- `void derived_free_communicators(const int &max_iterator_concurrency, bool recurse_flag=true)`
  to subModel

- `void serve()`
  Completes when a termination message is received from stop_servers().

- `void stop_servers()`
  when RecastModel iteration is complete.

- `void inactive_view(short view, bool recurse_flag=true)`
  context and optionally recurse into subModel

- `const String & interface_id()`
  return the subModel interface identifier

- `int evaluation_id()`
  forwarded to subModel)

- `void set_evaluation_reference()`
  (request forwarded to subModel)
• void fine_grained_evaluation_counters ()
  request fine-grained evaluation reporting within subModel

• void print_evaluation_summary (std::ostream &s, bool minimal_header=false, bool relative_count=true) const
  forwarded to subModel

Private Member Functions

• void set_mapping (const ActiveSet &recast_set, ActiveSet &sub_model_set)
  into sub_model_set for use with subModel.

8.116.1 Detailed Description

in order to recast the form of its inputs and/or outputs.

The RecastModel class uses function pointers to allow recasting of the subModel input/output into new problem forms. This is currently used to recast SBO approximate subproblems, but can be used for multiobjective, input/output scaling, and other problem modifications in the future.

8.116.2 Constructor & Destructor Documentation

8.116.2.1 `RecastModel (Model & sub_model, size_t num_recast_primary_fns, size_t num_recast_secondary_fns, size_t recast_secondary_offset)`

alternate constructor

This alternate constructor defers initialization of the function pointers until a separate call to `initialize()`, and accepts the minimum information needed to construct currentVariables, currentResponse, and userDefined-Constraints. The resulting model is sufficiently complete for passing to an Iterator.
8.116.3 Member Function Documentation

8.116.3.1 void initialize (const Sizet2DArray & vars_map_indices, bool nonlinear_vars_mapping,
void(*)(const Variables & recast_vars, Variables & sub_model_vars) variables_map,
void(*)(const ActiveSet & recast_set, ActiveSet & sub_model_set) set_map,
const Sizet2DArray & primary_resp_map_indices, const Sizet2DArray & secondary_resp_map_indices, const
BoolDequeArray & nonlinear_resp_mapping, void(*)(const Variables & sub_model_vars, const
Variables & recast_vars, const Response & sub_model_response, Response & recast_response)
primary_resp_map, void(*)(const Variables & sub_model_vars, const Variables & recast_vars, const
Response & sub_model_response, Response & recast_response) secondary_resp_map)

This function is used for late initialization of the recasting functions. It is used in concert with the alternate constructor.

8.116.3.2 void update_from_sub_model () [private]

update current variables/labels/bounds/targets from subModel

Update inactive values and labels in currentVariables and inactive bound constraints in userDefinedConstraints from variables and constraints data within subModel.

The documentation for this class was generated from the following files:

- RecastModel.H
- RecastModel.C

8.117.1 Detailed Description

Response provides the handle class.

The Response class is a container class for an abstract set of functions (functionValues) and their first (function-Gradients) and second (functionHessians) derivatives. The functions may involve objective and constraint functions (optimization data set), least squares terms (parameter estimation data set), or generic response functions (uncertainty quantification data set). It is not currently part of a class hierarchy, since the abstraction has been sufficiently general and has not required specialization. For memory efficiency, it employs the "handle-body idiom" approach to reference counting and representation sharing (see Coplien "Advanced C++", p. 58), for which Response serves as the handle and ResponseRep serves as the body.

8.117.2 Constructor & Destructor Documentation

8.117.2.1 Response ()

default constructor

Need a populated problem description database to build a meaningful Response object, so set the response-Rep=NULL in default constructor for efficiency. This then requires a check on NULL in the copy constructor, assignment operator, and destructor.

The documentation for this class was generated from the following files:

- DakotaResponse.H
- DakotaResponse.C
8.118 ResponseRep Class Reference

ResponseRep provides the body class.

Private Member Functions

  of response functions

- void active_set_derivative_vector (const SizeArray &asdv)
  functionGradients/functionHessians if needed

**Private Attributes**

- int referenceCount
  number of handle objects sharing responseRep

- RealVector functionValues
abstract set of response functions

- RealMatrix functionGradients
  first derivatives of the response functions

- RealSymMatrixArray functionHessians
  second derivatives of the response functions

- ActiveSet responseActiveSet
  copy of the ActiveSet used by the Model to generate a Response instance

- StringArray functionLabels
  response function identifiers used to improve output readability

- String idResponses
  response identifier string from the input file

Friends

- class Response
  the handle class can access attributes of the body class directly

- bool operator==(const ResponseRep &rep1, const ResponseRep &rep2)
  equality operator

8.118.1 Detailed Description

ResponseRep provides the body class.

The ResponseRep class is the "representation" of the response container class. It is the "body" portion of the "handle-body idiom" (see Coplien "Advanced C++", p. 58). The handle class (Response) provides for memory efficiency in management of multiple response objects through reference counting and representation sharing. The body class (ResponseRep) actually contains the response data (functionValues, functionGradients, function-Hessians, etc.). The representation is hidden in that an instance of ResponseRep may only be created by Response. Therefore, programmers create instances of the Response handle class, and only need to be aware of the handle/body mechanisms when it comes to managing shallow copies (shared representation) versus deep copies (separate representation used for history mechanisms).

8.118.2 Constructor & Destructor Documentation

8.118.2.1 ResponseRep (const Variables & vars, const ProblemDescDB & problem_db) [private]

standard constructor built from problem description database
The standard constructor used by Dakota::ModelRep.
8.118 ResponseRep Class Reference

8.118.2.2 **ResponseRep** (const `ActiveSet & set`) [private]

alternate constructor using limited data

Used for building a response object of the correct size on the fly (e.g., by slave analysis servers performing execute() on a local_response). `functionLabels` is not needed for this purpose since it’s not passed in the MPI send/recv buffers. However, NPSOLOptimizer’s user-defined functions option uses this constructor to build best-ResponseArray.front() and bestResponseArray.front() needs functionLabels for I/O, so construction of function-Labels has been added.

8.118.3 Member Function Documentation

8.118.3.1 **void read (std::istream & s)** [private]

read a responseRep object from an std::istream

ASCII version of read needs capabilities for capturing data omissions or formatting errors (resulting from user error or asynch race condition) and analysis failures (resulting from nonconvergence, instability, etc.).

8.118.3.2 **void write (std::ostream & s) const** [private]

write a responseRep object to an std::ostream

ASCII version of write.

8.118.3.3 **void read_annotated (std::istream & s)** [private]

read a responseRep object from an std::istream (annotated format)

`read_annotated()` is used for neutral file translation of restart files. Since objects are built solely from this data, annotations are used. This version closely mirrors the **BiStream** version.

8.118.3.4 **void write_annotated (std::ostream & s) const** [private]

write a responseRep object to an std::ostream (annotated format)

`write_annotated()` is used for neutral file translation of restart files. Since objects need to be built solely from this data, annotations are used. This version closely mirrors the **BoStream** version, with the exception of the use of white space between fields.

8.118.3.5 **void read_tabular (std::istream & s)** [private]

read functionValues from an std::istream (tabular format)

`read_tabular` is used to read functionValues in tabular format. It is currently only used by ApproximationInterfaces in reading samples from a file. There is insufficient data in a tabular file to build complete response objects; rather, the response object must be constructed a priori and then its functionValues can be set.
8.118.3.6 void write_tabular (std::ostream & s) const  [private]

write functionValues to an std::ostream (tabular format)
write_tabular is used for output of functionValues in a tabular format for convenience in post-processing/plotting of DAKOTA results.

8.118.3.7 void read (BiStream & s)  [private]

read a responseRep object from a binary stream
Binary version differs from ASCII version in 2 primary ways: (1) it lacks formatting. (2) the Response has not been sized a priori. In reading data from the binary restart file, a ParamResponsePair was constructed with its default constructor which called the Response default constructor. Therefore, we must first read sizing data and resize all of the arrays.

8.118.3.8 void write (BoStream & s) const  [private]

write a responseRep object to a binary stream
Binary version differs from ASCII version in 2 primary ways: (1) It lacks formatting. (2) In reading data from the binary restart file, ParamResponsePairs are constructed with their default constructor which calls the Response default constructor. Therefore, we must first write sizing data so that ResponseRep::read(BoStream& s) can resize the arrays.

8.118.3.9 void read (MPIUnpackBuffer & s)  [private]

read a responseRep object from a packed MPI buffer
UnpackBuffer version differs from BiStream version in the omission of functionLabels. Master processor retains labels and interface ids and communicates asv and response data only with slaves.

8.118.3.10 void write (MPIPackBuffer & s) const  [private]

write a responseRep object to a packed MPI buffer
MPIPackBuffer version differs from BoStream version only in the omission of functionLabels. The master processor retains labels and ids and communicates asv and response data only with slaves.

8.118.3.11 void update (const RealVector & source_fn_vals, const RealMatrix & source_fn_grads, const RealSymMatrixArray & source_fn_hessians, const ActiveSet & source_set) const  [private]

update this response object from components of another response object
Copy function values/gradients/Hessians data _only_. Prevents unwanted overwriting of responseActiveSet, functionLabels, etc. Also, care is taken to account for differences in derivative variable matrix sizing.
### 8.118.3.12 `void update_partial (size_t start_index_target, size_t num_items, const RealVector & source_fn_vals, const RealMatrix & source_fn_grads, const RealSymMatrixArray & source_fn_hessians, const ActiveSet & source_set, size_t start_index_source)` [private]

Another response object
Copy function values/gradients/Hessians data _only_. Prevents unwanted overwriting of responseActiveSet, functionLabels, etc. Also, care is taken to account for differences in derivative variable matrix sizing.

### 8.118.3.13 `void reshape (const size_t & num_fns, const size_t & num_params, bool grad_flag, bool hess_flag)` [private]

Reshape response data arrays
Reshape functionValues, functionGradients, and functionHessians according to num_fns, num_params, grad_flag, and hess_flag.

### 8.118.3.14 `void reset ()` [private]

Resets all response data to zero
Reset all numerical response data (not labels, ids, or active set) to zero.

### 8.118.3.15 `void reset_inactive ()` [private]

Resets all inactive response data to zero
Used to clear out any inactive data left over from previous evaluations.

### 8.118.4 Member Data Documentation

#### 8.118.4.1 `RealMatrix functionGradients` [private]

First derivatives of the response functions
The gradient vectors (plural) are column vectors in the matrix (singular) with (row, col) = (variable index, response fn index).

Private Attributes

- short `studyType`
  `CONVERGE_ORDER`, or `CONVERGE_QOI`.

- size_t `numFactors`
  number of refinement factors defined from active state variables

- RealVector `initialCVars`
  initial reference values for refinement factors

- size_t `factorIndex`
  the index of the active factor

- Real `refinementRate`
  rate of mesh refinement (default = 2.)

- RealMatrix `convOrder`
  the orders of convergence of the QOIs (numFunctions by numFactors)

- RealMatrix `extrapQOI`
  the extrapolated value of the QOI (numFunctions by numFactors)

- RealMatrix `numErrorQOI`
  (numFunctions by numFactors)

- RealVector `refinementRefPt`
  in the final refinement triple.

8.119.1 Detailed Description

Class for Richardson extrapolation for code and solution verification.
The `RichExtrapVerification` class contains several algorithms for performing Richardson extrapolation.

8.119.2 Member Function Documentation

8.119.2.1 void `print_results` (std::ostream & s) [virtual]

print the final iterator results
This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().
Reimplemented from Verification.

8.119.2.2 void estimate_order () [private]
perform a single estimation of convOrder using extrapolation()
This algorithm executes a single refinement triple and returns convergence order estimates.

8.119.2.3 void converge_order () [private]
iterate using extrapolation() until convOrder stabilizes
This algorithm continues to refine until the convergence order estimate converges.

8.119.2.4 void converge_qoi () [private]
iterate using extrapolation() until QOIs stabilize
This algorithm continues to refine until the discretization error lies within a prescribed tolerance.

- `static RealArray rawData`
  
  array to hold temporary data before sort

8.120.1 Detailed Description

and variance-based decomposition

This class provides code for several of the sampling methods both in the NonD branch and in the PStudyDACE branch. Currently, the utility functions provide global sensitivity analysis through correlation calculations (e.g. simple, partial, rank, raw) as well as variance-based decomposition.

The documentation for this class was generated from the following files:

- `SensAnalysisGlobal.H`
- `SensAnalysisGlobal.C`
8.121 SequentialHybridStrategy Class Reference

models of varying fidelity.

  *constructor*

- ∼**SequentialHybridStrategy** ()
  
  *destructor*

Protected Member Functions

- void **run_strategy** ()
  
  *run iterators on different models of varying fidelity*

- const Variables & **variables_results** () const
  
  *return the final solution from selected Iterators (variables)*

- const Response & **response_results** () const
  
  *return the final solution from selected Iterators (response)*

- void **initialize_iterator** (int job_index)
  
  *scheduling function (serve_iterators() or static_schedule_iterators())*

- void **pack_parameters_buffer** (MPIPackBuffer & send_buffer, int job_index)
  
  *pack a send_buffer for assigning an iterator job to a server*

- void **unpack_parameters_buffer** (MPIUnpackBuffer & recv_buffer)
  
  *unpack a recv_buffer for accepting an iterator job from the scheduler*

- void **pack_results_buffer** (MPIPackBuffer & send_buffer, int job_index)
  
  *pack a send_buffer for returning iterator results from a server*
• void unpack_results_buffer (MPIUnpackBuffer &recv_buffer, int job_index)
  unpack a recv_buffer for accepting iterator results from a server

• void update_local_results (int job_index)
  update local PRP results arrays with current iteration results

Private Member Functions

• void run_sequential ()
  run a sequential hybrid

• void run_sequential_adaptive ()
  run a sequential adaptive hybrid

• void partition_sets (size_t num_sets, int job_index, size_t &start_index, size_t &job_size)
  extraction from parameterSets

• void extract_parameter_sets (int job_index, VariablesArray &partial_param_sets)
  extract partial_param_sets from parameterSets based on job_index

• void update_local_results (PRPArray &prp_results, int job_id)
  update the partial set of final results from the local iterator execution

• void initialize_iterator (const VariablesArray &param_sets)
  initialize_iterator(int) to update the active Model and Iterator

Private Attributes

• String hybridType
  sequential or sequential_adaptive

• size_t seqCount
  hybrid sequence counter: 0 to numIterators-1

• Real progressMetric
  a sequential adaptive hybrid

• Real progressThreshold
  sequential adaptive hybrid switches to the next method

• PRP2DArray prpResults
  of results per job (iterators may return multiple final solutions)
8.121 SequentialHybridStrategy Class Reference

- VariablesArray parameterSets

  1-D array of variable starting points for the iterator jobs

8.121.1 Detailed Description

models of varying fidelity.

The sequential hybrid minimization strategy has two approaches: (1) the non-adaptive sequential hybrid runs one method to completion, passes its best results as the starting point for a subsequent method, and continues this succession until all methods have been executed (the stopping rules are controlled internally by each minimizer), and (2) the adaptive sequential hybrid uses adaptive stopping rules for the minimizers that are controlled externally by the strategy. Note that while the strategy is targeted at minimizers, any iterator may be used so long as it defines the notion of a final solution which can be passed as the starting point for subsequent iterators.

8.121.2 Member Function Documentation

8.121.2.1 void pack_parameters_buffer (MPIPackBuffer & send_buffer, int job_index) [inline, protected, virtual]

pack a send_buffer for assigning an iterator job to a server

This virtual function redefinition is executed on the dedicated master processor for self scheduling. It is not used for peer partitions.

Reimplemented from Strategy.

8.121.2.2 void unpack_parameters_buffer (MPIUnpackBuffer & recv_buffer) [inline, protected, virtual]

unpack a recv_buffer for accepting an iterator job from the scheduler

This virtual function redefinition is executed on an iterator server for dedicated master self scheduling. It is not used for peer partitions.

Reimplemented from Strategy.

8.121.2.3 void pack_results_buffer (MPIPackBuffer & send_buffer, int job_index) [inline, protected, virtual]

pack a send_buffer for returning iterator results from a server

This virtual function redefinition is executed either on an iterator server for dedicated master self scheduling or on peers 2 through n for static scheduling.

Reimplemented from Strategy.
8.121.2.4  void unpack_results_buffer (MPIUnpackBuffer & recv_buffer, int job_index)  [inline, protected, virtual]

unpack a recv_buffer for accepting iterator results from a server

This virtual function redefinition is executed on an strategy master (either the dedicated master processor for self scheduling or peer 1 for static scheduling).

Reimplemented from Strategy.

8.121.2.5  void run_sequential ()  [private]

run a sequential hybrid

In the sequential nonadaptive case, there is no interference with the iterators. Each runs until its own convergence criteria is satisfied. Status: fully operational.

8.121.2.6  void run_sequential_adaptive ()  [private]

run a sequential adaptive hybrid

In the sequential adaptive case, there is interference with the iterators through the use of the ++ overloaded operator. iterator++ runs the iterator for one cycle, after which a progress_metric is computed. This progress metric is used to dictate method switching instead of each iterator’s internal convergence criteria. Status: incomplete.

8.121.2.7  void extract_parameter_sets (int job_index, VariablesArray & partial_param_sets)  [inline, private]

extract partial_param_sets from parameterSets based on job_index

This convenience function is executed on an iterator master (static scheduling) or a strategy master (self scheduling) at run initialization time and has access to the full parameterSets array (this is All-Reduced for all peers at the completion of each cycle in run_sequential()).

  *Destructor*

### Protected Member Functions

- **int derived_map_ac (const Dakota::String &ac_name)**
  
  *Execute an analysis code portion of a direct evaluation invocation*

8.122.1 Detailed Description

plug-ins using assign_rep().

The plug-in SerialDirectApplicInterface resides in namespace SIM and uses a copy of rosenbrock() to perform serial parameter to response mappings. It may be activated by specifying the --with-plugin configure option, which activates the DAKOTA_PLUGIN macro in dakota_config.h used by main.C (which activates the plug-in code block within that file) and activates the PLUGIN_S declaration defined in Makefile.include and used in Makefile.source (which add this class to the build). Test input files should then use an analysis_driver of "plugin_ - rosenbrock".

The documentation for this class was generated from the following files:

- PluginSerialDirectApplicInterface.H

8.123.1 Detailed Description

among a set of Variables instances.

An array of Variables objects (e.g., Analyzer::allVariables) contains repeated configuration data (id’s, labels, counts). SharedVariablesData employs a handle-body idiom to allow this shared data to be managed in a single object with many references to it, one per Variables object in the array. This allows scaling to larger sample sets.

The documentation for this class was generated from the following file:

- SharedVariablesData.H
or body, may be shared by multiple SharedVariablesData handle instances.

8.124.1 Detailed Description

or body, may be shared by multiple SharedVariablesData handle instances.
The SharedVariablesData/SharedVariablesDataRep pairs utilize a handle-body idiom (Coplien, Advanced C++).
8.124.2 Constructor & Destructor Documentation

8.124.2.1 SharedVariablesDataRep (const ProblemDescDB & problem_db, const std::pair< short, short > & view) [private]

standard constructor

This constructor is the one which must build the base class data for all derived classes. get_variables() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_variables() again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Variables).

8.124.3 Member Data Documentation

8.124.3.1 SizetMultiArray allContinuousIds [private]

variables array

These identifiers define positions of the all continuous variables array within the total variable sequence.

functions in order to avoid the need for static data

8.128.1 Detailed Description

Wrapper class for the OPT++ optimization library.

The SNLLLeastSq class provides a wrapper for OPT++, a C++ optimization library of nonlinear programming and pattern search techniques from the Computational Sciences and Mathematics Research (CSMR) department at Sandia’s Livermore CA site. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function, a static member, or accessed by static pointer.

The user input mappings are as follows: max_iterations, max_function_evaluations, convergence_tolerance, max_step, gradient_tolerance, search_method, and search_scheme_size are set using OPT++’s setMaxIter(), setMaxFeval(), setFcnTol(), setMaxStep(), setGradTol(), setSearchStrategy(), and setSSS() member functions, respectively; output verbosity is used to toggle OPT++’s debug mode using the setDebug() member function. Internal to OPT++, there are 3 search strategies, while the DAKOTA search_method specification supports 4 (value_based_line_search, gradient_based_line_search, trust_region, or tr_pds). The difference stems from the "is_expensive" flag in OPT++. If the search strategy is LineSearch and "is_expensive" is turned on, then the value_based_line_search is used. Otherwise (the "is_expensive" default is off), the algorithm will use the gradient_based_line_search. Refer to [Meza, J.C., 1994] and to the OPT++ source in the Dakota/packages/OPTPP directory for information on OPT++ class member functions.

8.128.2 Member Function Documentation

8.128.2.1 void nlf2_evaluator_gn (int mode, int n, const NEWMAT::ColumnVector & x, NEWMAT::Real & f, NEWMAT::ColumnVector & grad_f, NEWMAT::SymmetricMatrix & hess_f, int & result_mode) [static, private]

value, gradient, and Hessian using the Gauss-Newton approximation.

This nlf2 evaluator function is used for the Gauss-Newton method in order to exploit the special structure of the nonlinear least squares problem. Here, fx = sum (T_i - Tbar_i)^2 and Response is made up of residual functions and their gradients along with any nonlinear constraints. The objective function and its gradient vector and Hessian matrix are computed directly from the residual functions and their derivatives (which are returned from the Response object).
8.128.2.2 void constraint1_evaluator_gn (int mode, int n, const NEWMAT::ColumnVector & x, NEWMAT::ColumnVector & g, NEWMAT::Matrix & grad_g, int & result_mode) [static, private]

values and gradients to OPT++ Gauss-Newton methods.
While it does not employ the Gauss-Newton approximation, it is distinct from constraint1_evaluator() due to its need to anticipate the required modes for the least squares terms. This constraint evaluator function is used with diaggregated Hessian NIPS and is currently active.

8.128.2.3 void constraint2_evaluator_gn (int mode, int n, const NEWMAT::ColumnVector & x, NEWMAT::ColumnVector & g, NEWMAT::Matrix & grad_g, OPTPP::OptppArray<NEWMAT::SymmetricMatrix> & hess_g, int & result_mode) [static, private]

values, gradients, and Hessians to OPT++ Gauss-Newton methods.
While it does not employ the Gauss-Newton approximation, it is distinct from constraint2_evaluator() due to its need to anticipate the required modes for the least squares terms. This constraint evaluator function is used with full Newton NIPS and is currently inactive.
The documentation for this class was generated from the following files:

- SNLLLeastSq.H
- SNLLLeastSq.C
8.129 SNLLOptimizer Class Reference

Wrapper class for the OPT++ optimization library.

#### 8.129.1 Detailed Description

Wrapper class for the OPT++ optimization library.

The **SNLLOptimizer** class provides a wrapper for OPT++, a C++ optimization library of nonlinear programming and pattern search techniques from the Computational Sciences and Mathematics Research (CSMR) department at Sandia’s Livermore CA site. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function, a static member, or accessed by static pointer.
The user input mappings are as follows: max_iterations, max_function_evaluations, convergence_tolerance, max_step, gradient_tolerance, search_method, and search_scheme_size are set using OPT++’s setMaxIter(), setMaxFeval(), setFcnTol(), setMaxStep(), setGradTol(), setSearchStrategy(), and setSSS() member functions, respectively; output verbosity is used to toggle OPT++’s debug mode using the setDebug() member function. Internal to OPT++, there are 3 search strategies, while the DAKOTA search_method specification supports 4 (value_based_line_search, gradient_based_line_search, trust_region, or tr_pds). The difference stems from the "is_expensive" flag in OPT++. If the search strategy is LineSearch and "is_expensive" is turned on, then the value_based_line_search is used. Otherwise (the "is_expensive" default is off), the algorithm will use the gradient_based_line_search. Refer to [Meza, J.C., 1994] and to the OPT++ source in the Dakota/packages/OPTPP directory for information on OPT++ class member functions.

8.129.2 Constructor & Destructor Documentation

8.129.2.1 SNLLOptimizer (Model & model)

standard constructor

This constructor is used for normal instantiations using data from the ProblemDescDB.

8.129.2.2 SNLLOptimizer (const String & method_name, Model & model)

alternate constructor for instantiations "on the fly"

This is an alternate constructor for instantiations on the fly using a Model but no ProblemDescDB.

8.129.2.3 SNLLOptimizer (const RealVector & initial_pt, const RealVector & var_l_bnds, const RealVector & var_u_bnds, const RealMatrix & lin_ineq_coeffs, const RealVector & lin_ineq_l_bnds, const RealVector & lin_ineq_u_bnds, const RealMatrix & lin_eq_coeffs, const RealVector & lin_eq_tgs, const RealVector & nln_ineq_u_bnds, const RealVector & nln_ineq_l_bnds, const RealVector & nln_eq_tgts, void(*)(int mode, int n, const NEWMAT::ColumnVector &x, NEWMAT::Real &f, NEWMAT::ColumnVector &grad_f, int &result_mode) user_obj_eval, void(*)(int mode, int n, const NEWMAT::ColumnVector &x, NEWMAT::Matrix &grad_g, int &result_mode) user_con_eval)

alternate constructor for instantiations "on the fly"

This is an alternate constructor for performing an optimization using the passed in objective function and constraint function pointers.

8.129.3 Member Function Documentation

8.129.3.1 void nlf0_evaluator (int n, const NEWMAT::ColumnVector & x, NEWMAT::Real & f, int & result_mode) [static, private]

require only function values.
For use when DAKOTA computes \( f \) and gradients are not directly available. This is used by nongradient-based optimizers such as PDS and by gradient-based optimizers in vendor numerical gradient mode (opt++’s internal finite difference routine is used).

### 8.129.3.2 void nlf1_evaluator (int \( mode \), int \( n \), const NEWMAT::ColumnVector & \( x \), NEWMAT::Real & \( f \), NEWMAT::ColumnVector & \( grad_f \), int & \( result_mode \)) [static, private]

values and gradients to OPT++ methods.

For use when DAKOTA computes \( f \) and \( df/dX \) (regardless of gradientType). Vendor numerical gradient case is handled by nlf0_evaluator.

### 8.129.3.3 void nlf2_evaluator (int \( mode \), int \( n \), const NEWMAT::ColumnVector & \( x \), NEWMAT::Real & \( f \), NEWMAT::ColumnVector & \( grad_f \), NEWMAT::SymmetricMatrix & \( hess_f \), int & \( result_mode \)) [static, private]

values, gradients, and Hessians to OPT++ methods.

For use when DAKOTA receives \( f \), \( df/dX \), & \( d^2f/dx^2 \) from the ApplicationInterface (analytic only). Finite differencing does not make sense for a full Newton approach, since lack of analytic gradients & Hessian should dictate the use of quasi-newton or fd-newton. Thus, there is no fdnlf2_evaluator for use with full Newton approaches, since it is preferable to use quasi-newton or fd-newton with nlf1. Gauss-Newton does not fit this model; it uses nlf2_evaluator_gn instead of nlf2_evaluator.

### 8.129.3.4 void constraint0_evaluator (int \( n \), const NEWMAT::ColumnVector & \( x \), NEWMAT::ColumnVector & \( g \), int & \( result_mode \)) [static, private]

only constraint values.

For use when DAKOTA computes \( g \) and gradients are not directly available. This is used by nongradient-based optimizers and by gradient-based optimizers in vendor numerical gradient mode (opt++’s internal finite difference routine is used).

### 8.129.3.5 void constraint1_evaluator (int \( mode \), int \( n \), const NEWMAT::ColumnVector & \( x \), NEWMAT::ColumnVector & \( g \), NEWMAT::Matrix & \( grad_g \), int & \( result_mode \)) [static, private]

values and gradients to OPT++ methods.

For use when DAKOTA computes \( g \) and \( dg/dX \) (regardless of gradientType). Vendor numerical gradient case is handled by constraint0_evaluator.

### 8.129.3.6 void constraint2_evaluator (int \( mode \), int \( n \), const NEWMAT::ColumnVector & \( x \), NEWMAT::ColumnVector & \( g \), NEWMAT::Matrix & \( grad_g \), OPTPP::OptppArray< NEWMAT::SymmetricMatrix > & \( hess_g \), int & \( result_mode \)) [static, private]

values, gradients, and Hessians to OPT++ methods.

For use when DAKOTA computes \( g \), \( dg/dX \), & \( d^2g/dx^2 \) (analytic only).

- **ParallelLibrary & parallelLib**
  class member reference to the parallel library

- **String strategyName**
  type of strategy: single_method, hybrid, multi_start, or pareto_set.

- **bool stratIterMessagePass**
  flag for message passing at si level

- **bool stratIterDedMaster**
  flag for dedicated master part. at si level

- **int worldRank**
  processor rank in MPI_COMM_WORLD

- **int worldSize**
  size of MPI_COMM_WORLD

- **int iteratorCommRank**
  processor rank in iteratorComm

- **int iteratorCommSize**
  number of processors in iteratorComm

- **int numIteratorServers**
  number of concurrent iterator partitions

- **int iteratorServerId**
  identifier for an iterator server

- **bool graph2DFlag**
  flag for using 2D graphics plots

- **bool tabularDataFlag**
  flag for file tabulation of graphics data

- **String tabularDataFile**
  filename for tabulation of graphics data

- **int maxConcurrency**
  maximum iterator concurrency possible in Strategy
- int numIteratorJobs
  
  number of iterator executions to schedule

- int paramsMsgLen
  
  length of MPI buffer for parameter input instance(s)

- int resultsMsgLen
  
  length of MPI buffer for results output instance(s)

Private Member Functions

- Strategy * get_strategy() 
  
  Used by the envelope to instantiate the correct letter class.

Private Attributes

- Strategy * strategyRep
  
  pointer to the letter (initialized only for the envelope)

- int referenceCount
  
  number of objects sharing strategyRep

8.131.1 Detailed Description

Base class for the strategy class hierarchy.

The Strategy class is the base class for the class hierarchy providing the top level control in DAKOTA. The strategy is responsible for creating and managing iterators and models. For memory efficiency and enhanced polymorphism, the strategy hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (Strategy) serves as the envelope and one of the derived classes (selected in Strategy::get_strategy()) serves as the letter.

8.131.2 Constructor & Destructor Documentation

8.131.2.1 Strategy()

default constructor

Default constructor. strategyRep is NULL in this case (a populated problem_db is needed to build a meaningful Strategy object). This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.
8.131.2.2 Strategy (ProblemDescDB & problem_db)

envelope constructor
Used in main.C instantiation to build the envelope. This constructor only needs to extract enough data to properly execute get_strategy, since Strategy::Strategy(BaseConstructor, problem_db) builds the actual base class data inherited by the derived strategies.

8.131.2.3 Strategy (const Strategy & strat)

copy constructor
Copy constructor manages sharing of strategyRep and incrementing of referenceCount.

8.131.2.4 ~Strategy () [virtual]
destructor
Destructor decrements referenceCount and only deletes strategyRep when referenceCount reaches zero.

8.131.2.5 Strategy (BaseConstructor, ProblemDescDB & problem_db) [protected]
derived class constructors - Coplien, p. 139)
This constructor is the one which must build the base class data for all inherited strategies. get_strategy() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_strategy() again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Strategy).

8.131.3 Member Function Documentation

8.131.3.1 Strategy operator= (const Strategy & strat)

assignment operator

8.131.3.2 void pack_parameters_buffer (MPIPackBuffer & send_buffer, int job_index) [protected, virtual]

pack a send_buffer for assigning an iterator job to a server
This virtual function redefinition is executed on the dedicated master processor for self scheduling. It is not used for peer partitions.
Reimplemented in ConcurrentStrategy, and SequentialHybridStrategy.
8.131 Strategy Class Reference

8.131.3.3 void unpack_parameters_buffer (MPIUnpackBuffer & recv_buffer) [protected, virtual]

unpack a recv_buffer for accepting an iterator job from the scheduler
This virtual function redefinition is executed on an iterator server for dedicated master self scheduling. It is not used for peer partitions.
Reimplemented in ConcurrentStrategy, and SequentialHybridStrategy.

8.131.3.4 void pack_results_buffer (MPIPackBuffer & send_buffer, int job_index) [protected, virtual]

pack a send_buffer for returning iterator results from a server
This virtual function redefinition is executed either on an iterator server for dedicated master self scheduling or on peers 2 through n for static scheduling.
Reimplemented in ConcurrentStrategy, and SequentialHybridStrategy.

8.131.3.5 void unpack_results_buffer (MPIUnpackBuffer & recv_buffer, int job_index) [protected, virtual]

unpack a recv_buffer for accepting iterator results from a server
This virtual function redefinition is executed on an strategy master (either the dedicated master processor for self scheduling or peer 1 for static scheduling).
Reimplemented in ConcurrentStrategy, and SequentialHybridStrategy.

8.131.3.6 void init_iterator_parallelism () [protected]

parallel configuration attributes, and managing outputs and restart.
This function is called from derived class constructors once maxConcurrency is defined but prior to instantiating Iterators and Models.

8.131.3.7 void init_iterator (Iterator & the_iterator, Model & the_model) [protected]

convenience function for allocating comms prior to running an iterator
This is a convenience function for encapsulating the allocation of communicators prior to running an iterator. It does not require a strategyRep forward since it is only used by letter objects.

8.131.3.8 void run_iterator (Iterator & the_iterator, Model & the_model) [protected]

due to use by MINLPNode.
This is a convenience function for encapsulating the parallel features (run/serve) of running an iterator. This function omits allocation/deallocation of communicators to provide greater efficiency in those strategies which involve multiple iterator executions but only require communicator allocation/deallocation to be performed once.
It does not require a strategyRep forward since it is only used by letter objects. While it is currently a public function due to its use in MINLPNode, this usage still involves a strategy letter object.

8.131.3.9  void free_iterator (Iterator & the_iterator, Model & the_model)  [protected]

convenience function for deallocating comms after running an iterator

This is a convenience function for encapsulating the deallocation of communicators after running an iterator. It does not require a strategyRep forward since it is only used by letter objects.

8.131.3.10  void schedule_iterators (Iterator & the_iterator, Model & the_model)  [protected]

static_schedule_iterators()

This implementation supports the scheduling of multiple jobs using a single iterator/model pair. Additional future (overloaded) implementations could involve independent iterator instances.

8.131.3.11  void self_schedule_iterators (Model & the_model)  [protected]

among slave iterator servers (called by derived run_strategy())

This function is adapted from ApplicationInterface::self_schedule_evaluations().

8.131.3.12  void serve_iterators (Iterator & the_iterator, Model & the_model)  [protected]

assigned by the strategy master (called by derived run_strategy())

This function is similar in structure to ApplicationInterface::serve_evaluations_synch().

8.131.3.13  Strategy * get_strategy ()  [private]

Used by the envelope to instantiate the correct letter class.

Used only by the envelope constructor to initialize strategyRep to the appropriate derived type, as given by the strategyName attribute.

The documentation for this class was generated from the following files:

- DakotaStrategy.H
- DakotaStrategy.C
8.132 String Class Reference

Dakota::String class, used as main string class for Dakota.

Public Member Functions

- **String ()**
  
  Default constructor.

- **String (const String &a)**
  
  Copy constructor for incoming String.

- **String (const String &a, size_t start_index, size_t num_items)**
  
  Copy constructor for portion of incoming String.

- **String (const char ∗c_string)**
  
  Copy constructor for incoming char* array.

- **String (const std::string &a)**
  
  Copy constructor for incoming base string.

- **~String ()**
  
  Destructor.

- **String & operator= (const String &)**
  
  Assignment operator for incoming String.

- **String & operator= (const std::string &)**
  
  Assignment operator for incoming base string.

- **String & operator= (const char ∗)***
  
  Assignment operator for incoming char* array.

- **operator const char * () const**
  
  The operator() returns pointer to standard C char array.

- **String & toUpper ()**
  
  Convert to upper case string.

- **void upper ()**
  
  String & toLower ()
  
  Convert to lower case string.

- **void lower ()**
  
  bool contains (const char ∗sub_string) const
Returns true if String contains char\* substring.

- bool begins (const char \*sub_string) const
  
  Returns true if String starts with char\* substring.

- bool ends (const char \*sub_string) const
  
  Returns true if String ends with char\* substring.

- char \* data () const
  
  Returns pointer to standard C char array.

### 8.132.1 Detailed Description

Dakota::String class, used as main string class for Dakota.

The Dakota::String class is the common string class for Dakota. It provides a common interface for string operations whether using the std::string interface or the (legacy) RogueWave RWCString API.

### 8.132.2 Member Function Documentation

**8.132.2.1 operator const char \* () const [inline]**

The operator() returns pointer to standard C char array.

The operator () returns a pointer to a char string. Uses the STL c_str() method. This allows for the String to be used in method calls without having to call the data() or c_str() methods.

**8.132.2.2 void upper ()**

Private method which converts String to upper. Utilizes an STL iterator to step through the string and then calls the STL toupper() method. Needs to be done this way because STL only provides a single char toupper method.

**8.132.2.3 void lower ()**

Private method which converts String to lower. Utilizes an STL iterator to step through the string and then calls the STL tolower() method. Needs to be done this way because STL only provides a single char tolower method.

**8.132.2.4 bool contains (const char \* sub_string) const [inline]**

Returns true if String contains char\* substring.

Returns true if the String contains the char\* sub_string. Uses the STL find() method.
8.132 String Class Reference

8.132.2.5 bool begins (const char ∗ sub_string) const [inline]

Returns true if String starts with char* substring.
Returns true if the String begins with the char* sub_string. Uses the STL compare() method.

8.132.2.6 bool ends (const char ∗ sub_string) const [inline]

Returns true if String ends with char* substring.
Returns true if the String ends with the char* sub_string. Uses the STL compare() method.

8.132.2.7 char ∗ data () const [inline]

Returns pointer to standard C char array.
Returns a pointer to C style char array. Needed to mimic the Rogue Wave string class. USE WITH CARE.

8.133.1 Detailed Description

\textbf{Interface} between Surfpack and Dakota.

The \textbf{SurfpackApproximation} class is the interface between Dakota and Surfpack. Based on the information in the \textbf{ProblemDescDB} that is passed in through the constructor, \textbf{SurfpackApproximation} builds a Surfpack Surface object that corresponds to one of the following data-fitting techniques: polynomial regression, kriging, artificial neural networks, radial basis function network, or multivariate adaptive regression splines (MARS).
8.133.2 Member Function Documentation

8.133.2.1 void build () [protected, virtual]

and the appropriate Surfpack build method will be invoked
surfData will be deleted in dtor

Todo
Right now, we’re completely deleting the old data and then recopying the current data into a SurfData object. This was just the easiest way to arrive at a solution that would build and run.
This function is frequently called from addPoint rebuild, however, and it’s not good to go through this whole process every time one more data point is added.
Reimplemented from Approximation.

8.133.2.2 const RealSymMatrix & get_hessian (const RealVector & x) [protected, virtual]

retrieve the approximate function Hessian for a given parameter vector x

Todo
Make this acceptably efficient

Reimplemented from Approximation.

8.133.2.3 void checkForEqualityConstraints () [private]

point, gradient, and/or hessian
If there is an anchor point, add an equality constraint for its response value. Also add constraints for gradient and hessian, if applicable.

Todo
improve efficiency of conversion

8.133.2.4 SurfData * surrogates_to_surf_data () [private]

copy from SurrogateDataPoint to SurfPoint/SurfData
Copy the data stored in Dakota-style SurrogateDataPoint objects into Surfpack-style SurfPoint and SurfData objects.

8.134.1 Detailed Description

and updates a global surrogate model without trust region controls

This method uses a SurrogateModel to perform minimization (optimization or nonlinear least squares) through a set of iterations. At each iteration, a surrogate is built, the surrogate is minimized, and the optimal points from the surrogate are then evaluated with the “true” function, to generate new points upon which the surrogate for the next iteration is built.

The documentation for this class was generated from the following files:

- **short** `approxSubProbCon`
  
  ORIGINAL_CON.

- **Model** `approxSubProbModel`
  
  involve a RecastModel recursion applied to iteratedModel

- **bool** `recastSubProb`
  
  flag to indicate when approxSubProbModel involves a RecastModel recursion

- **short** `trConstraintRelax`
  
  points: NO_RELAX or HOMOTOPOY

- **short** `meritFnType`
  
  ADAPTIVE_PENALTY_MERIT, LAGRANGIAN_MERIT, or AUGMENTED_LAGRANGIAN_MERIT.

- **short** `acceptLogic`
  
  type of iterate acceptance test logic: FILTER or TR_RATIO

- **int** `penaltyIterOffset`
  
  for adaptive_penalty merit functions

- **short** `convergenceFlag`
  
  code indicating satisfaction of hard or soft convergence conditions

- **short** `softConvCount`
  
  count reaches softConvLimit, stop SBLM.

- **short** `softConvLimit`
  
  exceeded by softConvCount, stop SBLM.
**bool truthGradientFlag**
flags the use/availability of truth gradients within the SBLM process

**bool approxGradientFlag**
flags the use/availability of surrogate gradients within the SBLM process

**bool truthHessianFlag**
flags the use/availability of truth Hessians within the SBLM process

**bool approxHessianFlag**
flags the use/availability of surrogate Hessians within the SBLM process

**bool correctionFlag**
of each trust region

**bool globalApproxFlag**
flags the use of a global data fit surrogate (rsm, ann, mars, kriging)

**bool multiptApproxFlag**
flags the use of a multipoint data fit surrogate (TANA)

**bool localApproxFlag**
flags the use of a local data fit surrogate (Taylor series)

**bool hierarchApproxFlag**
flags the use of a model hierarchy/multifidelity surrogate

**bool newCenterFlag**
a new trust region center

**bool daceCenterPtFlag**
evaluations for global approximations (CCD, Box-Behnken)

**bool multiLayerBypassFlag**
(responseCenterTruth and responseStarTruth).

**bool useDerivsFlag**
are to be evaluated at each DACE point in global surrogate builds.

**RealVector nonlinIneqLowerBndsSlack**
individual violations of nonlinear inequality constraint lower bounds

**RealVector nonlinIneqUpperBndsSlack**
individual violations of nonlinear inequality constraint upper bounds

**RealVector nonlinEqTargetsSlack**
individual violations of nonlinear equality constraint targets

- **Real** \( \tau \)
  
  constraint relaxation parameter

- **Real** \( \alpha \)
  
  constraint relaxation parameter backoff parameter (multiplier)

- **Variables** \( \text{varsCenter} \)
  
  variables at the trust region center

- **Response** \( \text{responseCenterApprox} \)
  
  approx response at trust region center

- **Response** \( \text{responseStarApprox} \)
  
  approx response at SBLM cycle minimum

- **Response** \( \text{responseCenterTruth} \)
  
  truth response at trust region center

- **Response** \( \text{responseStarTruth} \)
  
  truth response at SBLM cycle minimum

### Static Private Attributes

  pointer to SBLM instance used in static member functions

### 8.135.1 Detailed Description

and nonlinear least squares.

This minimizer uses a **SurrogateModel** to perform minimization based on local, global, or hierarchical surrogates. It achieves provable convergence through the use of a sequence of trust regions and the application of surrogate corrections at the trust region centers.

### 8.135.2 Member Function Documentation

#### 8.135.2.1 **void minimize_surrogates ()** [private, virtual]

global, or hierarchical surrogates over a series of trust regions.
8.135 SurrBasedLocalMinimizer Class Reference

Trust region-based strategy to perform surrogate-based optimization in subregions (trust regions) of the parameter space. The minimizer operates on approximations in lieu of the more expensive simulation-based response functions. The size of the trust region is varied according to the goodness of the agreement between the approximations and the true response functions.

Implements SurrBasedMinimizer.

8.135.2.2 void hard_convergence_check (const Response & response_truth, const RealVector & c_vars, const RealVector & lower_bnds, const RealVector & upper_bnds) [private]

merit function near zero)

The hard convergence check computes the gradient of the merit function at the trust region center, performs a projection for active bound constraints (removing any gradient component directed into an active bound), and signals convergence if the 2-norm of this projected gradient is less than convergenceTol.

8.135.2.3 void tr_ratio_check (const RealVector & c_vars_star, const RealVector & tr_lower_bnds, const RealVector & tr_upper_bnds) [private]

region resizing) and check for soft convergence (diminishing returns)

Assess acceptance of SBLM iterate (trust region ratio or filter) and compute soft convergence metrics (number of consecutive failures, min trust region size, etc.) to assess whether the convergence rate has decreased to a point where the process should be terminated (diminishing returns).

8.135.2.4 void update_penalty (const RealVector & fns_center_truth, const RealVector & fns_star_truth) [private]

initialize and update the penaltyParameter

Scaling of the penalty value is important to avoid rejecting SBLM iterates which must increase the objective to achieve a reduction in constraint violation. In the basic penalty case, the penalty is ramped exponentially based on the iteration counter. In the adaptive case, the ratio of relative change between center and star points for the objective and constraint violation values is used to rescale penalty values.

8.135.2.5 void approx_subprob_objective_eval (const Variables & surrogate_vars, const Variables & recast_vars, const Response & surrogate_response, Response & recast_response) [static, private]

static function used to define the approximate subproblem objective.

Objective functions evaluator for solution of approximate subproblem using a RecastModel.

8.135.2.6 void approx_subprob_constraint_eval (const Variables & surrogate_vars, const Variables & recast_vars, const Response & surrogate_response, Response & recast_response) [static, private]

static function used to define the approximate subproblem constraints.
Constraint functions evaluator for solution of approximate subproblem using a `RecastModel`.

8.135.2.7 void hom_objective_eval (int & mode, int & n, double * tau_and_x, double & f, double * grad_f, int & ) [static, private]

homotopy constraint relaxation formulation.

NPSOL objective functions evaluator for solution of homotopy constraint relaxation parameter optimization. This constrained optimization problem performs the update of the tau parameter in the homotopy heuristic approach used to relax the constraints in the original problem.

8.135.2.8 void hom_constraint_eval (int & mode, int & ncnln, int & n, int & nrowj, int * needc, double * tau_and_x, double * c, double * cjac, int & nstate) [static, private]

homotopy constraint relaxation formulation.

NPSOL constraint functions evaluator for solution of homotopy constraint relaxation parameter optimization. This constrained optimization problem performs the update of the tau parameter in the homotopy heuristic approach used to relax the constraints in the original problem.

8.136.1 Detailed Description

Base class for local/global surrogate-based optimization/least squares.

These minimizers use a SurrogateModel to perform optimization based either on local trust region methods or global updating methods.

8.136.2 Member Function Documentation

8.136.2.1 void run () [inline, protected, virtual]

and may include pre/post steps in lieu of separate pre/post

Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from Iterator.
8.136.2.2  void print_results (std::ostream & s)  [protected, virtual]

Redefines default iterator results printing to include optimization results (objective functions and constraints).
Reimplemented from Iterator.

8.136.2.3  void update_lagrange_multipliers (const RealVector & fn_vals, const RealMatrix & fn_grads)  [protected]

initialize and update Lagrange multipliers for basic Lagrangian
For the Rockafellar augmented Lagrangian, simple Lagrange multiplier updates are available which do not require
the active constraint gradients. For the basic Lagrangian, Lagrange multipliers are estimated through solution of
a nonnegative linear least squares problem.

8.136.2.4  void update_augmented_lagrange_multipliers (const RealVector & fn_vals)  [protected]

initialize and update the Lagrange multipliers for augmented Lagrangian
For the Rockafellar augmented Lagrangian, simple Lagrange multiplier updates are available which do not require
the active constraint gradients. For the basic Lagrangian, Lagrange multipliers are estimated through solution of
a nonnegative linear least squares problem.

8.136.2.5  bool update_filter (const RealVector & fn_vals)  [protected]

update a filter from a set of function values
Update the sbFilter with fn_vals if new iterate is non-dominated.

8.136.2.6  Real lagrangian_merit (const RealVector & fn_vals, const RealVector & nln_ineq_l_bnds, const
RealVector & nln_ineq_u_bnds, const RealVector & nln_eq_tgts)  [protected]

compute a Lagrangian function from a set of function values
The Lagrangian function computation sums the objective function and the Lagrange multiplier terms for inequality/equality constraints. This implementation follows the convention in Vanderplaats with $g \leq 0$ and $h=0$. The bounds/targets passed in may reflect the original constraints or the relaxed constraints.

8.136.2.7  Real augmented_lagrangian_merit (const RealVector & fn_vals, const RealVector &
nln_ineq_l_bnds, const RealVector & nln_ineq_u_bnds, const RealVector & nln_eq_tgts)  [protected]

compute an augmented Lagrangian function from a set of function values
The Rockafellar augmented Lagrangian function sums the objective function, Lagrange multiplier terms for inequality/equality constraints, and quadratic penalty terms for inequality/equality constraints. This implementation follows the convention in Vanderplaats with $g \leq 0$ and $h=0$. The bounds/targets passed in may reflect the original constraints or the relaxed constraints.
8.136.2.8  **Real penalty_merit (const RealVector \& fn_vals)**  [protected]

compute a penalty function from a set of function values

The penalty function computation applies a quadratic penalty to any constraint violations and adds this to the objective function(s) \( p = f + r_p \cdot cv \).

8.136.2.9  **Real objective (const RealVector \& fn_vals)**  [protected]

compute a composite objective value from one or more objective functions

The composite objective computation sums up the contributions from one of more objective functions using the multiobjective weights.

8.136.2.10  **void objective_gradient (const RealVector \& fn_vals, const RealMatrix \& fn_grads, RealVector \& obj_grad)**  [protected]

compute the gradient of the composite objective function

The composite objective gradient computation sums up the contributions from one of more objective function gradients using the multiobjective weights.

8.136.2.11  **Real constraintViolation (const RealVector \& fn_vals, const Real \& constraint_tol)**  [protected]

compute the constraint violation from a set of function values

Compute the quadratic constraint violation defined as \( cv = g^+^T g^+ + h^+^T h^+ \). This implementation supports equality constraints and 2-sided inequalities. The constraint_tol allows for a small constraint infeasibility (used for penalty methods, but not Lagrangian methods).

  flag indicating the need for additive correction calculations

- bool computeMultiplicative
  flag indicating the need for multiplicative correction calculations

- RealVector addCorrFns
  high and low fidelity model values at x=x_center.

- RealMatrix addCorrGrads
  high/low function difference at x=x_center.

- RealSymMatrixArray addCorrHessians
  high/low function difference at x=x_center.

- RealVector multCorrFns
  high fidelity to low fidelity model values at x=x_center.

- RealMatrix multCorrGrads
  of the high/low function ratio at x=x_center.

- RealSymMatrixArray multCorrHessians
  of the high/low function ratio at x=x_center.

- RealVector combineFactors
  correction instead of a strictly local correction.

- RealVector correctionCenterPt
  (x - x_c) terms in 1st-/2nd-order corrections.

- RealVector correctionPrevCenterPt
  copy of correctionCenterPt from the previous correction cycle.
• RealVector $\text{approxFnsCenter}$
  unavailable when applying 1st-/2nd-order multiplicative corrections.

• RealVector $\text{approxFnsPrevCenter}$
  copy of $\text{approxFnsCenter}$ from the previous correction cycle

• RealMatrix $\text{approxGradsCenter}$
  unavailable when applying 1st-/2nd-order multiplicative corrections.

• RealVector $\text{truthFnsCenter}$
  Truth function values at the current correction point.

• RealVector $\text{truthFnsPrevCenter}$
  copy of $\text{truthFnsCenter}$ from the previous correction cycle

• Variables $\text{subModelVars}$
  among differing variable views in $\text{force_rebuild()}$

• Constraints $\text{subModelCons}$
  among differing variable views in $\text{force_rebuild()}$

8.137.1 Detailed Description

Base class for surrogate models (DataFitSurrModel and HierarchSurrModel).
The SurrogateModel class provides common functions to derived classes for computing and applying corrections to approximations.

8.137.2 Member Function Documentation

8.137.2.1 void $\text{compute_correction (const Response & truth_response, const Response & approx_response, const RealVector & c_vars)}$ [protected, virtual]

agreement with truth_response
Compute an additive or multiplicative correction that corrects the approx_response to have 0th-order consistency (matches values), 1st-order consistency (matches values and gradients), or 2nd-order consistency (matches values, gradients, and Hessians) with the truth_response at a single point (e.g., the center of a trust region). The 0th-order, 1st-order, and 2nd-order corrections use scalar values, linear scaling functions, and quadratic scaling functions, respectively, for each response function.
Reimplemented from Model.
8.137.2.2 bool force_rebuild () [protected, virtual]

forced based on changes in the inactive data

This function forces a rebuild of the approximation according to the sub-model variables view, the approximation type, and whether the active approximation bounds or inactive variable values have changed since the last approximation build.

Reimplemented from Model.

8.137.3 Member Data Documentation

8.137.3.1 bool autoCorrection [protected]

and HierarchSurrModel approximate response computations

SurrBasedOptStrategy must toggle this value since compute_correction() no longer automatically backs out an old correction.

8.137.3.2 size_t approxBuilds [protected]

number of calls to build_approximation()

used as a flag to automatically build the approximation if one of the derived compute_response functions is called prior to build_approximation().

The documentation for this class was generated from the following files:

- SurrogateModel.H
- SurrogateModel.C
8.138 **SysCallAnalysisCode Class Reference**

Simulations using system calls.

Inheritance diagram for `SysCallAnalysisCode`:

  *Spawn a single analysis as part of a function evaluation*

- **void `spawn_output_filter` (const bool `block_flag`)**
  *Spawn the output filter portion of a function evaluation*

#### 8.138.1 Detailed Description

Simulations using system calls.

`SysCallAnalysisCode` creates separate simulation processes using the C `system()` command. It utilizes Command-Shell to manage shell syntax and asynchronous invocations.

#### 8.138.2 Member Function Documentation

**8.138.2.1 void `spawn_evaluation` (const bool `block_flag`)**

Spawn a complete function evaluation
Put the `SysCallAnalysisCode` to the shell. This function is used when all portions of the function evaluation (i.e., all analysis drivers) are executed on the local processor.

### 8.138.2.2 void spawn_input_filter (const bool block_flag)

spawn the input filter portion of a function evaluation

Put the input filter to the shell. This function is used when multiple analysis drivers are spread between processors. No need to check for a Null input filter, as this is checked externally. Use of nonblocking shells is supported in this fn, although its use is currently prevented externally.

### 8.138.2.3 void spawn_analysis (const int & analysis_id, const bool block_flag)

spawn a single analysis as part of a function evaluation

Put a single analysis to the shell. This function is used when multiple analysis drivers are spread between processors. Use of nonblocking shells is supported in this fn, although its use is currently prevented externally.

### 8.138.2.4 void spawn_output_filter (const bool block_flag)

spawn the output filter portion of a function evaluation

Put the output filter to the shell. This function is used when multiple analysis drivers are spread between processors. No need to check for a Null output filter, as this is checked externally. Use of nonblocking shells is supported in this fn, although its use is currently prevented externally.

- IntSet sysCallSet
  system call evaluations
- IntShortMap failCountMap
  map linking function evaluation id's to number of response read failures

8.139.1 Detailed Description

using system calls.
SysCallApplicInterface uses a SysCallAnalysisCode object for performing simulation invocations.

8.139.2 Member Function Documentation

8.139.2.1 void derived_synch (PRPQueue & prp_queue) [inline, virtual]

Check for completion of active asynch jobs (tracked with sysCallSet). Wait for at least one completion and complete all jobs that have returned. This satisfies a "fairness" principle, in the sense that a completed job will _always_ be processed (whereas accepting only a single completion could always accept the same completion - the case of very inexpensive fn. evals. - and starve some servers).
Reimplemented from ApplicationInterface.

8.139.2.2 void derived_synch_nowait (PRPQueue & prp_queue) [inline, virtual]

Check for completion of active asynch jobs (tracked with sysCallSet). Make one pass through sysCallSet & complete all jobs that have returned.
Reimplemented from ApplicationInterface.

8.139.2.3 int derived_synchronous_local_analysis (const int & analysis_id) [inline, virtual]

This code provides the derived function used by ApplicationInterface::serve_analyses_synch().
Reimplemented from ApplicationInterface.
The documentation for this class was generated from the following files:
• SysCallApplicInterface.H
• SysCallApplicInterface.C
approximation (a multipoint approximation).

Private Member Functions

- void find_scaled_coefficients ()
  compute TANA coefficients based on scaled inputs

- void offset (const RealVector &x, RealVector &s)
  based on minX, apply offset scaling to x to define s

Private Attributes

- RealVector pExp
  vector of exponent values

- RealVector minX
  vector of minimum parameter values used in scaling

- RealVector scX1
  vector of scaled x1 values

- RealVector scX2
  vector of scaled x2 values

- Real H
  the scalar Hessian value in the TANA-3 approximation

8.140.1 Detailed Description

approximation (a multipoint approximation).

The TANA3Approximation class provides a multipoint approximation based on matching value and gradient data from two points (typically the current and previous iterates) in parameter space. It forms an exponential approximation in terms of intervening variables.

8.140.2 Member Function Documentation

8.140.2.1 void clear_current () [inline, protected, virtual]

Redefine default implementation to support history mechanism.
Reimplemented from Approximation.

The documentation for this class was generated from the following files:

- TANA3Approximation.H
- TANA3Approximation.C
8.141 TaylorApproximation Class Reference

series (a local approximation).

series (a local approximation).

The `TaylorApproximation` class provides a local approximation based on data from a single point in parameter space. It uses a first- or second-order Taylor series expansion: 

\[ f(x) = f(x_c) + \text{grad}(x_c)' (x - x_c) + (x - x_c)' \text{Hess}(x_c) (x - x_c) / 2. \]

The documentation for this class was generated from the following files:

- TaylorApproximation.C
8.142 TrackerHTTP Class Reference

curl library

Public Member Functions

- TrackerHTTP ()
  and outputs on all ranks

- TrackerHTTP (ProblemDescDB &problem_db, int world_rank=0)
  standard constructor with ProblemDescDB, rank

- ~TrackerHTTP ()
  destructor to free handles

- void post_start ()
  post the start of an analysis and archive start time

- void post_finish (unsigned runtime=0)
  post the completion of an analysis including elapsed time

Private Member Functions

- void initialize (int world_rank=0)
  shared initialization functions across constructors

- void url_add_field (std::string &url, const char *keyword, const std::string &value, bool delimit=true) const
  set delimit = false to omit the &

- void build_default_data (std::string &url, std::time_t &rawtime, const std::string &mode) const
  construct URL with shared information for start/finish

- void send_data_using_get (const std::string &urltopost) const
  whole url including location&fields

- void send_data_using_post (const std::string &datatopost) const
  separate location and query; datatopost="name=daniel&project=curl"

- void populate_method_list (ProblemDescDB &problem_db)
  extract list of methods from problem database

- std::string get_uid () const
  get the real user ID
• std::string get_username () const
  get the username as reported by the environment

• std::string get_hostname () const
  get the system hostname

• std::string get_os () const
  get the operating system

• std::string get_datetime (const std::time_t &rawtime) const
  get the date and time as a string YYYYMMDDHHMMSS

Private Attributes

• CURL * curlPtr
  pointer to the curl handler instance

• FILE * devNull
  pointer to /dev/null

• std::string trackerLocation
  base URL for the tracker

• std::string proxyLocation
  (unlike default CURL behavior)

• long timeoutSeconds
  seconds until the request will timeout (may have issues with signals)

• std::string methodList
  list of active methods

• std::string dakotaVersion
  DAKOTA version.

• std::time_t startTime
  cached starting time in raw seconds

• short outputLevel
  verbosity control

  set a label within the all discrete label array

- StringMultiArrayView all_discrete_real_variable_labels () const
  returns a single array with all discrete variable labels

- void all_discrete_real_variable_labels (StringMultiArrayConstView adrv_labels)
  sets all discrete variable labels using a single array

- void all_discrete_real_variable_label (const String &adrv_label, size_t index)
  set a label within the all discrete label array

- UShortMultiArrayConstView all_continuous_variable_types () const
  return all continuous variable types

- UShortMultiArrayConstView all_discrete_int_variable_types () const
  return all discrete variable types

- UShortMultiArrayConstView all_discrete_real_variable_types () const
  return all discrete variable types

- SizetMultiArrayConstView all_continuous_variable_ids () const
  return all continuous variable position identifiers

- Variables copy () const
  for use when a deep copy is needed (the representation is _not_ shared)

- const std::pair< short, short > & view () const
  returns variablesView

- std::pair< short, short > get_view (const ProblemDescDB &problem_db) const
  defines variablesView from problem_db attributes

- void inactive_view (short view2)
  sets the inactive view based on higher level (nested) context
● const String & variables_id () const  
  returns the variables identifier string

● const SizetArray & variables_components_totals () const  
  returns the number of variables for each of the constitutive components

● bool is_null () const  
  function to check variablesRep (does this envelope contain a letter)

### Protected Member Functions

  number of inactive continuous variables

• `size_t numIDIV`
  number of inactive discrete integer variables

• `size_t numIDRV`
  number of inactive discrete real variables

• `RealVector continuousVars`
  the active continuous variables array view

• `IntVector discreteIntVars`
  the active discrete integer variables array view

• `RealVector discreteRealVars`
  the active discrete real variables array view

• `RealVector inactiveContinuousVars`
  the inactive continuous variables array view
• IntVector inactiveDiscreteIntVars
the inactive discrete integer variables array view

• RealVector inactiveDiscreteRealVars
the inactive discrete real variables array view

Private Member Functions

• Variables * get_variables (const ProblemDescDB &problem_db)  
correct letter class

• Variables * get_variables (const SharedVariablesData &svd) const  
and by copy() to instantiate a new letter class

• void check_view_compatibility ()  
perform sanity checks on view.first and view.second after update

Private Attributes

• Variables * variablesRep  
pointer to the letter (initialized only for the envelope)

• int referenceCount  
number of objects sharing variablesRep

Friends

• bool operator== (const Variables &vars1, const Variables &vars2)  
equality operator

• bool operator!= (const Variables &vars1, const Variables &vars2)  
inequality operator

• std::size_t hash_value (const Variables &vars)  
hash_value

• bool binary_equal_to (const Variables &vars1, const Variables &vars2)  
binary_equal_to (since 'operator==' is not suitable for boost/hash_set)
8.143.1 Detailed Description

Base class for the variables class hierarchy. The Variables class is the base class for the class hierarchy providing design, uncertain, and state variables for continuous and discrete domains within a Model. Using the fundamental arrays from the input specification, different derived classes define different views of the data. For memory efficiency and enhanced polymorphism, the variables hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (Variables) serves as the envelope and one of the derived classes (selected in Variables::get_variables()) serves as the letter.

8.143.2 Constructor & Destructor Documentation

8.143.2.1 Variables ()

default constructor

The default constructor: variablesRep is NULL in this case (a populated problem_db is needed to build a meaningful Variables object). This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

8.143.2.2 Variables (const ProblemDescDB & problem_db)

standard constructor

This is the primary envelope constructor which uses problem_db to build a fully populated variables object. It only needs to extract enough data to properly execute get_variables(problem_db), since the constructor overloaded with BaseConstructor builds the actual base class data inherited by the derived classes.

8.143.2.3 Variables (const SharedVariablesData & svd)

alternate constructor for instantiations on the fly

This is the alternate envelope constructor for instantiations on the fly. This constructor executes get_variables(view), which invokes the default derived/base constructors, followed by a resize() based on vars_comps.

8.143.2.4 Variables (const Variables & vars)

copy constructor

Copy constructor manages sharing of variablesRep and incrementing of referenceCount.

8.143.2.5 ~Variables () [virtual]

destructor

Destructor decrements referenceCount and only deletes variablesRep when referenceCount reaches zero.
8.143 Variables Class Reference

8.143.2.6 Variables (BaseConstructor, const ProblemDescDB & problem_db, const std::pair< short, short >& view) [protected]

derived class constructors - Coplien, p. 139)
This constructor is the one which must build the base class data for all derived classes. get_variables() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_variables() again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Variables).

8.143.2.7 Variables (BaseConstructor, const SharedVariablesData & svd) [protected]

derived class constructors - Coplien, p. 139)
This constructor is the one which must build the base class data for all derived classes. get_variables() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_variables() again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Variables).

8.143.3 Member Function Documentation

8.143.3.1 Variables operator= (const Variables & vars)

assignment operator

8.143.3.2 Variables copy () const

for use when a deep copy is needed (the representation is _not_ shared)
Deep copies are used for history mechanisms such as bestVariablesArray and data_pairs since these must catalogue copies (and should not change as the representation within currentVariables changes).

8.143.3.3 void build_views () [inline, protected]

construct active/inactive views of all variables arrays
= EMPTY)
= EMPTY)

8.143.3.4 Variables * get_variables (const ProblemDescDB & problem_db) [private]

correct letter class
Initialize variablesRep to the appropriate derived type, as given by problem_db attributes. The standard derived class constructors are invoked.
8.143.3.5 Variables * get_variables (const SharedVariablesData & svd) const [private]

and by copy() to instantiate a new letter class

Initializes variablesRep to the appropriate derived type, as given by view. The default derived class constructors are invoked.

The documentation for this class was generated from the following files:

- DakotaVariables.H
- DakotaVariables.C
8.144 Verification Class Reference

Base class for managing common aspects of verification studies.

Inheritance diagram for Verification::

  Redefines the run_iterator virtual function for the PStudy/DACE branch.

8.144.1 Detailed Description

Base class for managing common aspects of verification studies.

The Verification base class manages common data and functions, such as those involving ...
8.144.2 Member Function Documentation

8.144.2.1 void run () [inline, protected, virtual]

and may include pre/post steps in lieu of separate pre/post
Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.
Reimplemented from Iterator.

8.144.2.2 void print_results (std::ostream & s) [protected, virtual]

print the final iterator results
This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().
Reimplemented from Analyzer.
Reimplemented in RichExtrapVerification.

DAKOTA File Documentation

9.1 dll_api.C File Reference

This file contains a DakotaRunner class, which launches DAKOTA.

Namespaces

- namespace Dakota

Functions

- void signal_init ()
  initialize signal handlers

- void DAKOTA_DLL_FN dakota_create (int *dakota_ptr_int, char *logname)
  create and configure a new DakotaRunner, adding it to list of instances

- int DAKOTA_DLL_FN dakota_readInput (int id, char *dakotaInput)
  command DakotaRunner instance id to read from file dakotaInput

- void DAKOTA_DLL_FN dakota_get_variable_info (int id, char ***pVarNames, int *pNumVarNames, char ***pRespNames, int *pNumRespNames)
  return the variable and response names

- int DAKOTA_DLL_FN dakota_start (int id)
  command DakotaRunner instance id to start (plugin interface and run strategy)

- void DAKOTA_DLL_FN dakota_destroy (int id)
  delete Dakota runner instance id and remove from active list

- void DAKOTA_DLL_FN dakota_stop (int *id)
command DakotaRunner instance id to stop execution

- const char *DAKOTA_DLL_FN dakota_getStatus (int id)
  return current results output as a string

- int get_mc_ptr_int ()
  get the DAKOTA pointer to ModelCenter

- void set_mc_ptr_int (int ptr_int)
  set the DAKOTA pointer to ModelCenter

- int get_dc_ptr_int ()
  get the DAKOTA pointer to ModelCenter current design point

- void set_dc_ptr_int (int ptr_int)
  set the DAKOTA pointer to ModelCenter current design point

Variables

- PRPCache data_pairs
  contains all parameter/response pairs.

- std::map< int, DakotaRunner * > runners
  map from DakotaRunner id to instance

9.1.1 Detailed Description

This file contains a DakotaRunner class, which launches DAKOTA.

9.1.2 Function Documentation

9.1.2.1 void DAKOTA_DLL_FN dakota_stop (int * id)

command DakotaRunner instance id to stop execution

TODO: trick application to quit through the syscall interface or throw exception.
9.2 dll_api.h File Reference

API for DLL interactions.

Functions

- void DAKOTA_DLL_FN dakota_create (int *dakota_ptr_int, char *logname)
  create and configure a new DakotaRunner, adding it to list of instances

- int DAKOTA_DLL_FN dakota_readInput (int id, char *dakotaInput)
  command DakotaRunner instance id to read from file dakotaInput

- int DAKOTA_DLL_FN dakota_start (int id)
  command DakotaRunner instance id to start (plugin interface and run strategy)

- void DAKOTA_DLL_FN dakota_destroy (int id)
  delete Dakota runner instance id and remove from active list

- void DAKOTA_DLL_FN dakota_stop (int *id)
  command DakotaRunner instance id to stop execution

- const char *DAKOTA_DLL_FN dakota_getStatus (int id)
  return current results output as a string

- int DAKOTA_DLL_FN get_mc_ptr_int ()
  get the DAKOTA pointer to ModelCenter

- void DAKOTA_DLL_FN set_mc_ptr_int (int ptr_int)
  set the DAKOTA pointer to ModelCenter

- int DAKOTA_DLL_FN get_dc_ptr_int ()
  get the DAKOTA pointer to ModelCenter current design point

- void DAKOTA_DLL_FN set_dc_ptr_int (int ptr_int)
  set the DAKOTA pointer to ModelCenter current design point

- void DAKOTA_DLL_FN dakota_get_variable_info (int id, char ***pVarNames, int *pNumVarNames,
  char ***pRespNames, int *pNumRespNames)
  return the variable and response names

9.2.2 Function Documentation

9.2.2.1 void DAKOTA_DLL_FN dakota_stop (int * id)

command DakotaRunner instance id to stop execution

TODO: trick application to quit through the syscall interface or throw exception.
9.3  JEGAOptimizer.C File Reference

Contains the implementation of the JEGAOptimizer class.

Namespaces

- namespace Dakota
- namespace JEGA::Logging
- namespace eddy::utilities

Classes

- class JEGAOptimizer::Evaluator
  
  An evaluator specialization that knows how to interact with Dakota.

- class JEGAOptimizer::EvaluatorCreator
  
  A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a Evaluator.

- class JEGAOptimizer::Driver
  
  A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm.

Functions

- template<typename T> string asstring (const T &val)
  
  Creates a string from the argument val using an ostringstream.

9.3.1  Detailed Description

Contains the implementation of the JEGAOptimizer class.
9.4 JEGAOptimizer.H File Reference

Contains the definition of the JEGAOptimizer class.

Namespaces

- namespace JEGA
- namespace JEGA::Utilities
- namespace JEGA::FrontEnd
- namespace JEGA::Algorithms
- namespace Dakota

Classes

- class JEGAOptimizer

  A version of Dakota::Optimizer for instantiation of John Eddy’s Genetic Algorithms (JEGA).

9.4.1 Detailed Description

Contains the definition of the JEGAOptimizer class.
9.5 library_mode.C File Reference

file containing a mock simulator main for testing DAKOTA in library mode

Namespaces

- namespace Dakota

Functions

- void nidr_set_input_string (const char *)
  Set input to NIDR via string argument instead of input file.

- int nidr_save_exedir (const char *, int)
- void run_dakota_parse (const char *dakota_input_file)
  mode 1: parsing an input file.

- void run_dakota_data ()
  mode 2: direct Data class instantiation.

- void run_dakota_mixed (const char *dakota_input_file)
  mode 3: mixed parsing and direct updating

- void model_interface_plugins (Dakota::ProblemDescDB &problem_db)
- int main (int argc, char *argv [])
  A mock simulator main for testing DAKOTA in library mode.

- void run_dakota_data ()
  mode 2: direct Data class instantiation.

- static void my_callback_function (void *ptr)

9.5.1 Detailed Description

file containing a mock simulator main for testing DAKOTA in library mode

9.5.2 Function Documentation

9.5.2.1 void run_dakota_parse (const char * dakota_input_file)

mode 1: parsing an input file.
This function parses from an input file to define the ProblemDescDB data.
9.5.2.2  void run_dakota_mixed (const char *dakota_input_file)

mode 3: mixed parsing and direct updating

This function showcases multiple features. For parsing, either an input file (dakota_input_file != NULL) or a
default input string (dakota_input_file == NULL) are shown. This parsed input is then mixed with input from three
sources: (1) input from a user-supplied callback function, (2) updates to the DB prior to Strategy instantiation, (3)
updates directly to Iterators/Models following Strategy instantiation.

9.5.2.3  void model_interface_plugins (Dakota::ProblemDescDB &problem_db)

Iterate over models and plugin appropriate interface: serial rosenbrock or parallel textbook.

9.5.2.4  int main (int argc, char *argv[])

A mock simulator main for testing DAKOTA in library mode.

Uses alternative instantiation syntax as described in the library mode documentation within the Developers Man-
ual. Tests several problem specification modes: (1) run_dakota_parse: reads all problem specification data from
an input file (2) run_dakota_data: creates all problem specification from direct Data instance instantiations. (3)
run_dakota_mixed: a mixture of input parsing (by file or default string) and direct data updates, where the data
updates occur: (a) via the DB prior to Strategy instantiation, and (b) via Iterators/Models following Strategy
instantiation. Usage: dakota_library_mode [-m] [dakota.in]

9.5.2.5  static void my_callback_function (void *ptr) [static]

Example of user-provided callback function to override input specified and managed by NIDR, e.g., from an input
deck.
9.6 library_split.C File Reference

file containing a mock simulator main for testing DAKOTA in library mode on a split communicator

Functions

- **void** `manage_mpi`(MPI_Comm &my_comm, int &color)
  
  Split MPI_COMM_WORLD, returning the comm and color.

- **void** `gen_dakota_input`(const int &color, std::string &input)
  
  Return the appropriate DAKOTA input based on color (1 or 2).

- **void** `run_dakota`(const MPI_Comm &comm, const std::string &input, const int &color)
  
  Launch DAKOTA on passed communicator, tagging output/error with color.

- **void** `collect_results`()
  
  Wait for and collect results from DAKOTA runs.

- **void** `nidr_set_input_string`(const char *)
  
  Set input to NIDR via string argument instead of input file.

- **int** `main`(int argc, char *argv[])
  
  processors

9.6.1 Detailed Description

file containing a mock simulator main for testing DAKOTA in library mode on a split communicator
9.7 main.C File Reference

file containing the main program for DAKOTA

Functions

- void fpinit_ASL()
- int nidr_save_exedir (const char *, int)
- int main (int argc, char *argv[])

The main DAKOTA program.

9.7.1 Detailed Description

file containing the main program for DAKOTA

9.7.2 Function Documentation

9.7.2.1 void fpinit_ASL()

Floating-point initialization from AMPL: switch to 53-bit rounding if appropriate, to eliminate some cross-
platform differences.

9.7.2.2 int main (int argc, char *argv[])

The main DAKOTA program.

Manage command line inputs, input files, restart file(s), output streams, and top level parallel iterator communi-
cators. Instantiate the Strategy and invoke its run_strategy() virtual function.
9.8 restart_util.C File Reference

file containing the DAKOTA restart utility main program

Namespaces

- namespace Dakota

Functions

- void print_restart (int argc, char **argv, String print_dest)
  print a restart file

- void print_restart_tabular (int argc, char **argv, String print_dest)
  print a restart file (tabular format)

- void read_neutral (int argc, char **argv)
  read a restart file (neutral file format)

- void repair_restart (int argc, char **argv, String identifier_type)
  repair a restart file by removing corrupted evaluations

- void concatenate_restart (int argc, char **argv)
  concatenate multiple restart files

- int nidr_save_exedir (const char *, int)
- int main (int argc, char *argv[])

The main program for the DAKOTA restart utility.

9.8.1 Detailed Description

file containing the DAKOTA restart utility main program

9.8.2 Function Documentation

9.8.2.1 int main (int argc, char * argv[])

The main program for the DAKOTA restart utility.
Parse command line inputs and invoke the appropriate utility function (print_restart(), print_restart_tabular(), read_neutral(), repair_restart(), or concatenate_restart()).
Chapter 10

Recommended Practices for DAKOTA Development

10.1 Introduction

Common code development practices can be extremely useful in multiple developer environments. Particular styles for code components lead to improved readability of the code and can provide important visual cues to other developers.

Much of this recommended practices document is borrowed from the CUBIT mesh generation project, which in turn borrows its recommended practices from other projects. As a result, C++ coding styles are fairly standard across a variety of Sandia software projects in the engineering and computational sciences.

10.2 Style Guidelines

Style guidelines involve the ability to discern at a glance the type and scope of a variable or function.

10.2.1 Class and variable styles

Class names should be composed of two or more descriptive words, with the first character of each word capitalized, e.g.:

```cpp
class ClassName;
```

Class member variables should be composed of two or more descriptive words, with the first character of the second and succeeding words capitalized, e.g.:

```cpp
double classMemberVariable;
```

Temporary (i.e. local) variables are lower case, with underscores separating words in a multiple word temporary variable, e.g.:

```cpp
double class_member_variable;
```
int temporary_variable;

Constants (i.e. parameters) and enumeration values are upper case, with underscores separating words, e.g.:

const double CONSTANT_VALUE;

10.2.2 Function styles

Function names are lower case, with underscores separating words, e.g.:

int function_name();

There is no need to distinguish between member and non-member functions by style, as this distinction is usually clear by context. This style convention allows member function names which set and return the value of a similarly-named private member variable, e.g.:

int memberVariable;
void member_variable(int a) { // set
    memberVariable = a;
}
int member_variable() const { // get
    return memberVariable;
}

In cases where the data to be set or returned is more than a few bytes, it is highly desirable to employ const references to avoid unnecessary copying, e.g.:

void continuous_variables(const RealVector& c_vars) { // set
    continuousVariables = c_vars;
}
const RealVector& continuous_variables() const { // get
    return continuousVariables;
}

Note that it is not necessary to always accept the returned data as a const reference. If it is desired to be able change this data, then accepting the result as a new variable will generate a copy, e.g.:

const RealVector& c_vars = model.continuous_variables(); // reference to continuousVariables cannot be changed
RealVector c_vars = model.continuous_variables(); // local copy of continuousVariables can be changed

10.2.3 Miscellaneous

Appearance of typedefs to redefine or alias basic types is isolated to a few header files (data_types.h, template_defs.h), so that issues like program precision can be changed by changing a few lines of typedefs rather than many lines of code, e.g.:

typedef double Real;
**10.3 File Naming Conventions**

xemacs is the preferred source code editor, as it has C++ modes for enhancing readability through color (turn on "Syntax highlighting"). Other helpful features include "Paren highlighting" for matching parentheses and the "New Frame" utility to have more than one window operating on the same set of files (note that this is still the same edit session, so all windows are synchronized with each other). Window width should be set to 80 internal columns, which can be accomplished by manual resizing, or preferably, using the following alias in your shell resource file (e.g., .cshrc):

```bash
alias xemacs "xemacs -g 81x63"
```

where an external width of 81 gives 80 columns internal to the window and the desired height of the window will vary depending on monitor size. This window width imposes a coding standard since you should avoid line wrapping by continuing anything over 80 columns onto the next line.

Indenting increments are 2 spaces per indent and comments are aligned with the code they describe, e.g.:

```c
void abort_handler(int code)
{
    int initialized = 0;
    MPI_Init(&initialized);
    if (initialized) {
        // comment aligned to block it describes
        int size;
        MPI_Comm_size(MPI_COMM_WORLD, &size);
        if (size>1)
            MPI_Abort(MPI_COMM_WORLD, code);
        else
            exit(code);
    } else
        exit(code);
}
```

Also, the continuation of a long command is indented 2 spaces, e.g.:

```c
const String& iterator_scheduling
    = problem_db.get_string("strategy.iterator_scheduling");
```

and similar lines are aligned for readability, e.g.:

```c
cout << "Numerical gradients using " << finiteDiffStepSize * 100. << "%"
    << finiteDiffType << " differences\n to be calculated by the "
    << methodSource << " finite difference routine.\n" << endl;
```

Lastly, #ifdef’s are not indented (to make use of syntax highlighting in xemacs).

**10.3 File Naming Conventions**

In addition to the style outlined above, the following file naming conventions have been established for the DAKOTA project.

File names for C++ classes should, in general, use the same name as the class defined by the file. Exceptions include:
• with the introduction of the Dakota namespace, base classes which previously utilized prepended Dakota identifiers can now safely omit the identifiers. However, since file names do not have namespace protection from name collisions, they retain the prepended Dakota identifier. For example, a class previously named DakotaModel which resided in DakotaModel.[CH], is now Dakota::Model (class Model in namespace Dakota) residing in the same filenames. The retention of the previous filenames reduces the possibility of multiple instances of a Model.H causing problems. Derived classes (e.g., NestedModel) do not require a prepended Dakota identifier for either the class or file names.

• in a few cases, it is convenient to maintain several closely related classes in a single file, in which case the file name may reflect the top level class or some generalization of the set of classes (e.g., DakotaResponse.[CH] files contain Dakota::Response and Dakota::ResponseRep classes, and DakotaBinStream.[CH] files contain the Dakota::BiStream and Dakota::BoStream classes).

The type of file is determined by one of the four file name extensions listed below:

• .H A class header file ends in the suffix .H. The header file provides the class declaration. This file does not contain code for implementing the methods, except for the case of inline functions. Inline functions are to be placed at the bottom of the file with the keyword inline preceding the function name.

• .C A class implementation file ends in the suffix .C. An implementation file contains the definitions of the members of the class.

• .h A header file ends in the suffix .h. The header file contains information usually associated with procedures. Defined constants, data structures and function prototypes are typical elements of this file.

• .c A procedure file ends in the suffix .c. The procedure file contains the actual procedures.

10.4 Class Documentation Conventions

Class documentation uses the doxygen tool available from http://www.doxygen.org and employs the JAVA-doc comment style. Brief comments appear in header files next to the attribute or function declaration. Detailed descriptions for functions should appear alongside their implementations (i.e., in the .C files for non-inlined, or in the headers next to the function definition for inlined). Detailed comments for a class or a class attribute must go in the header file as this is the only option.

NOTE: Previous class documentation utilities (class2frame and class2html) used the "//-" comment style and comment blocks such as this:

```// Class: Model
// Description: The model to be iterated by the Iterator. Contains Variables, Interface, and Response objects.
// Owner: Mike Eldred
```

These tools are no longer used, so remaining comment blocks of this type are informational only and will not appear in the documentation generated by doxygen.
Chapter 11

Instructions for Modifying DAKOTA’s Input Specification

To modify DAKOTA’s input specification (for maintenance or addition of new input syntax), specification maintenance mode must be enabled at DAKOTA configure time with the \texttt{--enable-spec-maint} option, e.g.,

\texttt{./configure --enable-spec-maint}

This will enable regeneration of NIDR and DAKOTA components which must be updated following a spec change.

11.1 Modify \texttt{dakota.input.nspec}

The master input specification \texttt{dakota.input.nspec} in Dakota/src is the primary file to update when making a specification change. It uses the following syntactic elements:

- \texttt{() for required group specifications}
- \texttt{[] for optional specifications}
- \texttt{| for alternatives}
- \texttt{{} for functions to process keywords to express logical relationships. These syntactic elements can be used to express various dependency relationships in the input specification. It is recommended that you review the existing specification and have an understanding of the constructs in use before attempting to add new ones.}

\textbf{Warning:}

- Do \textit{not} skip this step. Attempts to modify the NIDR\_keywds.H file in Dakota/src without using the NIDR table generator are very error-prone. Moreover, the input specification provides a reference to the allowable inputs of a particular executable and should be kept in synch with the parser files; modifying the parser files independent of the input specification creates, at a minimum, undocumented features.
• All keywords in dakota.input.nspec are lower case by convention. All user inputs are converted to lower case by the parser prior to keyword match testing, resulting in case insensitive parsing.

• Since the NIDR parser allows abbreviation of keywords, you must avoid adding a keyword that could be misinterpreted as an abbreviation for a different keyword within the same top-level keyword, such as "strategy" and "method". For example, adding the keyword "expansion" within the method specification would be a mistake if the keyword "expansion_factor" already was being used in this specification.

• The NIDR input is somewhat order-dependent, allowing the same keyword to be reused multiple times in the specification. This often happens with aliases, such as lower_bounds, upper_bounds and initial_point. Ambiguities are resolved by attaching a keyword to the most recently seen context in which it could appear, if such exists, or to the first relevant context that subsequently comes along in the input file. With the earlier IDR parser, non-exclusive specifications (those not in mutually exclusive blocks) were required to be unique. That is why there are such aliases for initial_point as cdv_initial_point and ddv_initial_point: so older input files can be used with no or fewer changes.

11.2 Rebuild generated files

As of DAKOTA 5.1, a separate make command in packages/nidr is no longer necessary. When configured with --enable-spec-maint, performing a make in Dakota/src will regenerate all files which derive from dakota.input.nspec, including NIDR_keywds.H, dakota.input.summary, NIDR_guiywds.H, and dakota.input.desc. If you commit changes to a source repository, be sure to commit any automatically generated files in addition to any modified in the following steps. It is not strictly necessary to run make at this point in the sequence, and in fact may generate errors if necessary handlers aren’t yet available. One may optionally

```
cd Dakota/src
make nidr-files
```

to only rebuild generated dependencies of dakota.input.nspec.

11.3 Update NIDRProblemDescDB.C in Dakota/src

Many keywords have data associated with them: an integer, a floating-point number, a string, or arrays of such entities. Data requirements are specified in dakota.input.nspec by the tokens INTEGER, REAL, STRING, INTEGERLIST, REALLIST, STRINGLIST. (Some keywords have no associated data and hence no such token.) After each keyword and data token, the dakota.input.nspec file specifies functions that the NIDR parser should call to record the appearance of the keyword and deal with any associated data. The general form of this specification is

```
{ startfcn, startdata, stopfcn, stopdata }
```
i.e., a brace-enclosed list of one to four functions and data pointers, with trailing entities taken to be zero if not present; zero for a function means no function will be called. The startfcn must deal with any associated data. Otherwise, the distinction between startfcn and stopfcn is relevant only to keywords that begin a group of keywords (enclosed in parentheses or square brackets). The startfcn is called before other entities in the group are processed, and the stop function is called after they are processed. Top-level keywords often have both startfcn and stopfcn; stopfcn is uncommon but possible for lower-level keywords. The startdata and (if needed) stopdata values are usually pointers to little structures that provide keyword-specific details to generic functions for startfcn and
stopfcn. Some keywords that begin groups (such as "approx_problem" within the top-level "strategy" keyword) have no need of either a startfcn or a stopfcn; this is indicated by "[0]".

Most of the things within braces in dakota.input.nspec are invocations of macros defined in NIDRProblemDescDB.C. The macros simplify writing dakota.input.nspec and make it more readable. Most macro invocations refer to little structures defined in NIDRProblemDescDB.C, usually with the help of other macros, some of which have different definitions in different parts of NIDRProblemDescDB.C. When adding a keyword to dakota.input.nspec, you may need to add a structure definition or even introduce a new data type. NIDRProblemDescDB.C has sections corresponding to each top-level keyword. The top-level keywords are in alphabetical order, and most entities in the section for a top-level keyword are also in alphabetical order. While not required, it is probably good practice to maintain this structure, as it makes things easier to find.

Any integer, real, or string data associated with a keyword are provided to the keyword’s startfcn, whose second argument is a pointer to a Values structure, defined in header file nidr.h.

Example 1: if you added the specification:

```
[method_setting REAL {method_setting_start, &method_setting_details} ]
```

you would provide a function

```c
void NIDRProblemDescDB::
   method_setting_start(const char *keyname, Values *val, void **g, void *v)
   {
      ...
   }
```

in NIDRProblemDescDB.C. In this example, argument &method_setting_details would be passed as v, val->n (the number of values) would be 1 and *val->r would be the REAL value given for the method_setting keyword. The method_setting_start function would suitably store this value with the help of method_setting_details.

For some top-level keywords, g (the third argument to the startfcn and stopfcn) provides access to a relevant context. For example, method_start (the startfcn for the top-level method keyword) executes

```c
DataMethod *dm = new DataMethod;
*g = (void*)dm;
```

(and supplies a couple of default values to dm). The start functions for lower-level keywords within the method keyword get access to dm through their g arguments. Here is an example:

```c
void NIDRProblemDescDB::
   method_str(const char *keyname, Values *val, void **g, void *v)
   {
      (*(DataMethod**)g)->**(String DataMethod::**)v = *val->s;
   }
```

In this example, v points to a pointer-to-member, and an assignment is made to one of the components of the DataMethod object pointed to by *g. The corresponding stopfcn for the top-level method keyword is

```c
void NIDRProblemDescDB::
   method_stop(const char *keyname, Values *val, void **g, void *v)
   {
      DataMethod *p = *(DataMethod**)*g;
      pDDBInstance->dataMethodList.insert(*p);
      delete p;
   }
```
which copies the now populated DataMethod object to the right place and cleans up.

**Example 2:** if you added the specification

```
[method_setting REALLIST {{N_mdm(RealL,methodCoeffs)}
```

then method_RealL (defined in NIDRProblemDescDB.C) would be called as the startfcn, and methodCoeffs would be the name of a (currently nonexistent) component of DataMethod. The N_mdm macro is defined in NIDRProblemDescDB.C; among other things, it turns RealL into NIDRProblemDescDB::method_RealL. This function is used to process lists of REAL values for several keywords. By looking at the source, you can see that the list values are val->r[i] for 0 <= i < val->n.

### 11.4 Update ProblemDescDB.C in Dakota/src

#### 11.4.1 Augment/update get_<data_type>() functions

The next update step involves extending the database retrieval functions in ProblemDescDB.C. These retrieval functions accept an identifier string and return a database attribute of a particular type, e.g., a RealVector:

```
const RealVector& get_rdv(const String& entry_name);
```

The implementation of each of these functions contains tables of possible entry_name values and associated pointer-to-member values. There is one table for each relevant top-level keyword, with the top-level keyword omitted from the names in the table. Since binary search is used to look for names in these tables, each table must be kept in alphabetical order of its entry names. For example,

```c
...  
else if ((L = Begins(entry_name, "model.\"))) {
    if (dbRep->methodDBLocked)
        Locked_db();
    #define P &DataModelRep::
    static KW<RealVector, DataModelRep> RVdmo[] = { // must be sorted
        "nested.primary_response_mapping", P primaryRespCoeffs,
        "nested.secondary_response_mapping", P secondaryRespCoeffs,
        "surrogate.kriging_conmin_seed", P krigingConminSeed,
        "surrogate.kriging_correlations", P krigingCorrelations,
        "surrogate.kriging_max_correlations", P krigingMaxCorrelations,
        "surrogate.kriging_min_correlations", P krigingMinCorrelations};
    #undef P
    KW<RealVector, DataModelRep> *kw;
    if ((kw = (KW<RealVector, DataModelRep>*)Binsearch(RVdmo, L)))
        return dbRep->dataModelIter->dataModelRep->*kw->p;
}
```

is the "model" portion of ProblemDescDB::get_rdv(). Based on entry_name, it returns the relevant attribute from a DataModel object. Since there may be multiple model specifications, the dataModelIter list iterator identifies which node in the list of DataModel objects is used. In particular, dataModelList contains a list of all of the data_model objects, one for each time a top-level model keyword was seen by the parser. The particular model object used for the data retrieval is managed by dataModelIter, which is set in a set_db_list_nodes() operation that will not be described here.
11.5 Update Corresponding Data Classes

There may be multiple DataMethod, DataModel, DataVariables, DataInterface, and/or DataResponses objects. However, only one strategy specification is currently allowed so a list of DataStrategy objects is not needed. Rather, ProblemDescDB::strategySpec is the lone DataStrategy object.

To augment the get_<data_type>() functions, add table entries with new identifier strings and pointer-to-member values that address the appropriate data attributes from the Data class object. The style for the identifier strings is a top-down hierarchical description, with specification levels separated by periods and words separated with underscores, e.g., "keyword.group_specification.individual_specification". Use the db-Rep->listIter->attribute syntax for variables, interface, responses, and method specifications. For example, the method_setting example attribute would be added to get_drv() as:

    {"method_name.method_setting", P methodSetting},

inserted at the beginning of the RVdmo array shown above (since the name in the existing first entry, i.e., "nested.primary_response_mapping", comes alphabetically after "method_name.method_setting").

11.5 Update Corresponding Data Classes

In this step, we extend the Data class definitions (DataStrategy, DataMethod, DataModel, DataVariables, DataInterface, and/or DataResponses) to include the new attributes referenced in Update NIDRProblemDescDB.C in Dakota/src and Augment/update get_<data_type>() functions.

11.5.1 Update the Data class header file

Add a new attribute to the public data for each of the new specifications. Follow the style guide for class attribute naming conventions (or mimic the existing code).

11.5.2 Update the .C file

Define defaults for the new attributes in the constructor initialization list. Add the new attributes to the assign() function for use by the copy constructor and assignment operator. Add the new attributes to the write(MPIPackBuffer&), read(MPIUnpackBuffer&), and write(ostream&) functions, paying careful attention to the use of a consistent ordering.

11.6 Use get_<data_type>() Functions

At this point, the new specifications have been mapped through all of the database classes. The only remaining step is to retrieve the new data within the constructors of the classes that need it. This is done by invoking the get_<data_type>() function on the ProblemDescDB object using the identifier string you selected in Augment/update get_<data_type>() functions. For example:

    const String& interface_type = problem_db.get_string("interface.type");

passes the "interface.type" identifier string to the ProblemDescDB::get_string() retrieval function, which returns the desired attribute from the active DataInterface object.
Warning:

Use of the `get_<data_type>()` functions is restricted to class constructors, since only in class constructors are the data list iterators (i.e., `dataMethodIter`, `dataModelIter`, `dataVariablesIter`, `dataInterfaceIter`, and `dataResponsesIter`) guaranteed to be set correctly. Outside of the constructors, the database list nodes will correspond to the last set operation, and may not return data from the desired list node.

11.7 Update the Documentation

Doxygen comments should be added to the Data class headers for the new attributes, and the reference manual sections describing the portions of `dakota.input.nspec` that have been modified should be updated. In particular, the reference manual tables summarizing keywords provide help data to the Jaguar user interface so need to be kept updated.
11.8 Understanding Iterator Flow

This page explains the various phases comprising `Iterator::run_iterator()`. Prior to `Iterator` construction, when command-line options are parsed, Boolean run mode flags corresponding to PRERUN, RUN, and POSTRUN are set in `ParallelLibrary`. If the user didn’t specify any specific run modes, the default is for all three to be true (all phases will execute).

`Iterator` is constructed.

When called, `run_iterator()` sequences:

- `initialize_run()`: unconditionally called, virtual. Performs common initialization such as allocating workspaces, setting communicators and evaluation counts. When re-implementing this virtual, a derived class must call its nearest parent’s `initialize_run()`, typically before performing its own implementation steps.

- Not implemented: pre-run input

- IF PRERUN, invoke `pre_run()`: virtual function; default no-op. Purpose: derived classes should implement `pre_run()` if they are able to generate all parameter sets (variables) at once, separate from `run()`. Derived implementations should call their nearest parent’s `pre_run()`, typically before performing their own steps.

- IF PRERUN, invoke `pre_output()`: non-virtual function; if user requested, output variables to file.

- Not implemented: run input

- IF RUN, invoke virtual function `run()`. Purpose: at a minimum, evaluate parameter sets through computing responses; for iterators without pre/post capability, their entire implementation is in `run()` and this is a reasonable default for new Iterators.

- Not implemented: run output

- IF POSTRUN, invoke `post_input()`: virtual function, default only print helpful message on mode. Purpose: derived iterators supporting post-run input from file must implement to read file and populate variables/responses (and possibly best points) appropriately. Implementations must check if the user requested file input.

- IF POSTRUN, invoke `post_run()`: virtual function. Purpose: generate statistics / final results. Any analysis that can be done solely on tabular data read by `post_input()` can be done here. Derived re-implementations should call their nearest parent’s `post-run()`, typically after performing their specific post-run activities.

- Not implemented: post-run output

- `finalize_run()`: unconditionally called, virtual. Purpose: free workspaces. Default base class behavior is no-op, however, derived implementations should call their nearest parent’s `finalize_run` after performing their specialized portions.

`Iterator` is destructed.
Chapter 12

Interfacing with DAKOTA as a Library

12.1 Introduction

It is possible to link the DAKOTA toolkit into another application for use as an algorithm library. This section describes facilities which permit this type of integration.

As part of the normal DAKOTA build process, where Dakota/configure –prefix=PREFIX has been run prior to make and make install, a libdakota.a is created and a copy of it is placed in PREFIX/lib (PREFIX defaults to /usr/local/Dakota). This library contains all source files from Dakota/src excepting the main.C, restart_util.C, and library_mode.C main programs. This library may be linked with another application through inclusion of -ldakota on the link line. Library and header paths may also be specified using the -L and -I compiler options (using PREFIX/lib and PREFIX/include, respectively). Depending on the configuration used when building this library, other libraries for the vendor optimizers and vendor packages will also be needed to resolve DAKOTA symbols for DOT, NPSOL, OPT++, NCSUOpt, LHS, Teuchos, etc. Copies of these libraries are also placed in Dakota/lib. Refer to Linking against the DAKOTA library for additional information.

Warning:

Users may interface to DAKOTA as a library within other software applications provided that they abide by the terms of the GNU Lesser General Public License (LGPL). Refer to http://www.gnu.org/licenses/lgpl.html or contact the DAKOTA team for additional information.

Attention:

The use of DAKOTA as an algorithm library should be distinguished from the linking of simulations within DAKOTA using the direct application interface (see DirectApplicInterface). In the former, DAKOTA is providing algorithm services to another software application, and in the latter, a linked simulation is providing analysis services to DAKOTA. It is not uncommon for these two capabilities to be used in combination, where a simulation framework provides both the "front end" and the "back end" for DAKOTA.
12.2 Quick start: examples and test code

To learn by example, refer to the files PluginSerialDirectApplicInterface.[CH] and PluginParallelDirectApplicInterface.[CH] in Dakota/src for simple examples of serial and parallel plug-in interfaces. The file library_mode.C in Dakota/src provides example usage of these plug-ins within a mock simulator program that demonstrates the required object instantiation syntax in combination with the three problem database population approaches (input file parsing, data node insertion, and mixed mode). All of this code may be compiled and tested by configuring DAKOTA using the –with-plugin option.

12.3 Comparison to main.C

The procedure for utilizing DAKOTA as a library within another application involves a number of steps that are similar to those used in the stand-alone DAKOTA application. The stand-alone procedure can be viewed in the file main.C, and the differences for the library approach are most easily explained with reference to that file. The basic steps of executing DAKOTA include instantiating the ParallelLibrary, CommandLineHandler, and ProblemDescDB objects; managing the DAKOTA input file (ProblemDescDB::manage_inputs()); specifying restart files and output streams (ParallelLibrary::specify_outputs_restart()); and instantiating the Strategy and running it (Strategy::run_strategy()). When using DAKOTA as an algorithm library, the operations are quite similar, although command line information (argc, argv, and therefore CommandLineHandler) will not in general be accessible. In particular, main.C can pass argc and argv into the ParallelLibrary and CommandLineHandler constructors and then pass the CommandLineHandler object into ProblemDescDB::manage_inputs() and ParallelLibrary::specify_outputs_restart(). In an algorithm library approach, a CommandLineHandler object is not instantiated and overloaded forms of the ParallelLibrary constructor, ProblemDescDB::manage_inputs(), and ParallelLibrary::specify_outputs_restart() are used.

The overloaded forms of these functions are as follows. For instantiation of the ParallelLibrary object, the default constructor may be used. This constructor assumes that MPI is administered by the parent application such that the MPI configuration will be detected rather than explicitly created (i.e., DAKOTA will not call MPI_Init or MPI_Finalize). In code, the instantiation

```c
ParallelLibrary parallel_lib(argc, argv);
```

is replaced with

```c
ParallelLibrary parallel_lib;
```

In the case of specifying restart files and output streams, the call to

```c
parallel_lib.specify_outputs_restart(cmd_line_handler);
```

should be replaced with its overloaded form in order to pass the required information through the parameter list

```c
parallel_lib.specify_outputs_restart(std_output_filename, std_error_filename, 
  read_restart_filename, write_restart_filename, stop_restart_evals);
```

where file names for standard output and error and restart read and write as well as the integer number of restart evaluations are passed through the parameter list rather than read from the command line of the main DAKOTA

DAKOTA Version 5.1 Developers Manual generated on January 21, 2011
12.4 Problem database population

Now that the ProblemDescDB object has been instantiated, we must populate it with data, either via parsing an input file, direct data insertion, or a mixed approach, as described in the following sections.

12.4.1 Input file parsing

The simplest approach to linking an application with the DAKOTA library is to rely on DAKOTA’s normal parsing system to populate DAKOTA’s problem database (ProblemDescDB) through the reading of an input file. The disadvantage to this approach is the requirement for an additional input file beyond those already required by the parent application.

In this approach, the main.C call to

```c
problem_db.manage_inputs(cmd_line_handler);
```

would be replaced with its overloaded form

```c
problem_db.manage_inputs(dakota_input_file);
```

where the file name for the DAKOTA input is passed through the parameter list rather than read from the command line of the main DAKOTA program. Again, the definition of the DAKOTA input file name is performed elsewhere in the parent application (e.g., specified in the parent application input file or GUI). Refer to run_dakota_parse() in library_mode.C for a complete example listing.

ProblemDescDB::manage_inputs() invokes ProblemDescDB::parse_inputs() (which in turn invokes ProblemDescDB::check_input()), ProblemDescDB::broadcast(), and ProblemDescDB::post_process(), which are lower level functions that will be important in the following two sections. Thus, the input file parsing approach may employ a single coarse grain function to coordinate all aspects of problem database population, whereas the two approaches to follow will use lower level functions to accomplish a finer grain of control.

12.4.2 Data node insertion

This approach is more involved than the previous approach, but it allows the application to publish all needed data to DAKOTA’s database directly, thereby eliminating the need for the parsing of a separate DAKOTA input file. In this case, ProblemDescDB::manage_inputs() is not called. Rather, DataStrategy, DataMethod, DataModel,
DataVariables, DataInterface, and DataResponses objects are instantiated and populated with the desired problem data. These objects are then published to the problem database using ProblemDescDB::insert_node(), e.g.:

```cpp
// instantiate the data object
DataMethod data_method;

// set the attributes within the data object
data_method.methodName = "nond_sampling";
...

// publish the data object to the ProblemDescDB
problem_db.insert_node(data_method);
```

The data objects are populated with their default values upon instantiation, so only the non-default values need to be specified. Refer to the DataStrategy, DataMethod, DataModel, DataVariables, DataInterface, and DataResponses class documentation and source code for lists of attributes and their defaults.

The default strategy is single_method, which runs a single iterator on a single model, and the default model is single, so it is not necessary to instantiate and publish a DataStrategy or DataModel object if advanced multi-component capabilities are not required. Rather, instantiation and insertion of a single DataMethod, DataVariables, DataInterface, and DataResponses object is sufficient for basic DAKOTA capabilities.

Once the data objects have been published to the ProblemDescDB object, calls to

```cpp
problem_db.check_input();
problem_db.broadcast();
problem_db.post_process();
```

will perform basic database error checking, broadcast a packed MPI buffer of the specification data to other processors, and post-process specification data to fill in vector defaults (scalar defaults are handled in the Data class constructors), respectively. For parallel applications, processor rank 0 should be responsible for Data node population and insertion and the call to ProblemDescDB::check_input(), and all processors should participate in ProblemDescDB::broadcast() and ProblemDescDB::post_process(). Moreover, preserving the order shown assures that large default vectors are not transmitted by MPI. Refer to run_dakota_data() in library_mode.C for a complete example listing.

### 12.4.3 Mixed mode

In this case, we will combine the parsing of a DAKOTA input file with some direct database updates. The motivation for this approach arises in large-scale applications where large vectors can be awkward to specify in a DAKOTA input file. The first step is to parse the input file, but rather than using

```cpp
problem_db.manage_inputs(dakota_input_file);
```

as described in Input file parsing, we will use the lower level function

```cpp
problem_db.parse_inputs(dakota_input_file);
```

to provide a finer grain of control. The passed input file dakota_input_file must contain all required inputs. Since vector data like variable values/bounds/tags, linear/nonlinear constant coefficients/bounds, etc. are optional, these potentially large vector specifications can be omitted from the input file. Only the variable/response counts, e.g.:
are required in this case. To update the data omissions from their defaults, one uses the `ProblemDescDB::set()` family of overloaded functions, e.g.

```cpp
Dakota::RealVector drv(1000, 1.); // vector of length 1000, values initialized to 1.
problem_db.set("variables.continuous_design.initial_point", drv);
```

where the string identifiers are the same identifiers used when pulling information from the database using one of the `get_<datatype>()` functions (refer to the source code of ProblemDescDB.C for a full list). However, the supported `ProblemDescDB::set()` options are a restricted subset of the database attributes, focused on vector inputs that can be large scale.

If performing these updates within the constructor of a `DirectApplicInterface` extension/derivation (see Defining the direct application interface), then this code is sufficient since the database is unlocked, the active list nodes of the `ProblemDescDB` have been set for you, and the correct strategy/method/model/variables/interface/responses specification instance will get updated. The difficulty in this case stems from the order of instantiation. Since the `Variables` and `Response` instances are constructed in the base `Model` class, prior to construction of `Interface` instances in derived `Model` classes, database information related to `Variables` and `Response` objects will have already been extracted by the time the `Interface` constructor is invoked and the database update will not propagate.

Therefore, it is preferred to perform these operations at a higher level (e.g., within your main program), prior to `Strategy` instantiation and execution, such that instantiation order is not an issue. However, in this case, it is necessary to explicitly manage the list nodes of the `ProblemDescDB` using a specification instance identifier that corresponds to an identifier from the input file, e.g.:

```cpp
problem_db.set_db_variables_node("MY_VARIABLES_ID");
Dakota::RealVector drv(1000, 1.); // vector of length 1000, values initialized to 1.
problem_db.set("variables.continuous_design.initial_point", drv);
```

Alternatively, rather than setting just a single data node, all data nodes may be set using a method specification identifier:

```cpp
problem_db.set_db_list_nodes("MY_METHOD_ID");
```

since the method specification is responsible for identifying a model specification, which in turn identifies variables, interface, and responses specifications. If hardwiring specification identifiers is undesirable, then

```cpp
problem_db.resolve_top_method();
```

can also be used to deduce the active method specification and set all list nodes based on it. This is most appropriate in the case where only single specifications exist for method/model/variables/interface/responses. In each of these cases, setting list nodes unlocks the corresponding portions of the database, allowing set/get operations.
Once all direct database updates have been performed in this manner, calls to `ProblemDescDB::broadcast()` and `ProblemDescDB::post_process()` should be used on all processors. The former will broadcast a packed MPI buffer with the aggregated set of specification data from rank 0 to other processors, and the latter will post-process specification data to fill in any vector defaults that have not yet been provided through either file parsing or direct updates (Note: scalar defaults are handled in the Data class constructors). Refer to `run_dakota_mixed()` in `library_mode.C` for a complete example listing.

### 12.5 Instantiating the strategy

With the `ProblemDescDB` object populated with problem data, we may now instantiate the strategy.

```c++
// instantiate the strategy
Strategy selected_strategy(problem_db);
```

Following strategy construction, all MPI communicator partitioning has been performed and the `ParallelLibrary` instance may be interrogated for parallel configuration data. For example, the lowest level communicators in DAKOTA’s multilevel parallel partitioning are the analysis communicators, which can be retrieved using:

```c++
// retrieve the set of analysis communicators for simulation initialization:
// one analysis comm per ParallelConfiguration (PC), one PC per Model.
Array<MPI_Comm> analysis_comms = parallel_lib.analysis_intra_communicators();
```

These communicators can then be used for initializing parallel simulation instances, where the number of MPI communicators in the array corresponds to one communicator per `ParallelConfiguration` instance.

### 12.6 Defining the direct application interface

When employing a library interface to DAKOTA, it is frequently desirable to also use a direct interface between DAKOTA and the simulation. There are two approaches to defining this direct interface.

#### 12.6.1 Extension

The first approach involves extending the existing `DirectApplicInterface` class to support additional direct simulation interfaces. In this case, a new simulation interface function can be added to Dakota/src/DirectApplicInterface.[CH] for the simulation of interest. If the new function will not be a member function, then the following prototype should be used in order to pass the required data:

```c++
int sim(const Dakota::Variables& vars, const Dakota::ActiveSet& set, Dakota::Response& response);
```

If the new function will be a member function, then this can be simplified to

```c++
int sim();
```
12.6 Defining the direct application interface

since the data access can be performed through the DirectApplicInterface class attributes.

This simulation can then be added to the logic blocks in DirectApplicInterface::derived_map_ac(). In addition, DirectApplicInterface::derived_map_if() and DirectApplicInterface::derived_map_of() can be extended to perform pre- and post-processing tasks if desired, but this is not required.

While this approach is the simplest, it has the disadvantage that the DAKOTA library may need to be recompiled when the simulation or its direct interface is modified. If it is desirable to maintain the independence of the DAKOTA library from the host application, then the following derivation approach should be employed.

12.6.2 Derivation

The second approach is to derive a new interface from DirectApplicInterface in order to redefine several virtual functions. A typical derived class declaration might be

```cpp
namespace SIM {
  class SerialDirectApplicInterface: public Dakota::DirectApplicInterface {
    public:
      // Constructor and destructor
      SerialDirectApplicInterface(const Dakota::ProblemDescDB& problem_db);
      ~SerialDirectApplicInterface();

    protected:
      // Virtual function redefinitions
      int derived_map_if(const Dakota::String& if_name);
      int derived_map_ac(const Dakota::String& ac_name);
      int derived_map_of(const Dakota::String& of_name);

    private:
      // Data
    }
  } // namespace SIM
```

where the new derived class resides in the simulation’s namespace. Similar to the case of Extension, the DirectApplicInterface::derived_map_ac() function is the required redefinition, and DirectApplicInterface::derived_map_if() and DirectApplicInterface::derived_map_of() are optional.

The new derived interface object (from namespace SIM) must now be plugged into the strategy. In the simplest case of a single model and interface, one could use

```cpp
// retrieve the interface of interest
ModelList& all_models = problem_db.model_list();
Model& first_model = *all_models.begin();
Interface& interface = first_model.interface();
// plug in the new direct interface instance (DB does not need to be set)
interface.assign_rep(new SIM::SerialDirectApplicInterface(problem_db), false);
```

from within the Dakota namespace. In a more advanced case of multiple models and multiple interface plug-ins, one might use
// retrieve the list of Models from the Strategy
Modellist& models = problem_db.model_list();
// iterate over the Model list
for (ModellIter ml_iter = models.begin(); ml_iter != models.end(); ml_iter++) {
  Interface& interface = ml_iter->interface();
  if (interface.interface_type() == "direct" &&
      interface.analysis_drivers().contains("SIM") ) {
    // set the correct list nodes within the DB prior to new instantiations
    problem_db.set_db_model_nodes(ml_iter->model_id());
    // plug in the new direct interface instance
    interface.assign_rep(new SIM::SerialDirectApplicInterface(problem_db), false);
  }
}

In the case where the simulation interface instance should manage parallel simulations within the context of an
MPI communicator, one should pass in the relevant analysis communicator(s) to the derived constructor. For the
latter case of looping over a set of models, the simplest approach of passing a single analysis communicator would
use code similar to

const ParallelLevel& ea_level = ml_iter->parallel_configuration_iterator()->ea_parallel_level();
const MPI_Comm& analysis_comm = ea_level.server_intra_communicator();
interface.assign_rep(new SIM::ParallelDirectApplicInterface(problem_db, analysis_comm), false);

Since Models may be used in multiple parallel contexts and may therefore have a set of parallel configurations, a
more general approach would extract and pass an array of analysis communicators to allow initialization for each
of the parallel configurations.

New derived direct interface instances inherit various attributes of use in configuring the simulation. In particu-
lar, the ApplicationInterface::parallelLib reference provides access to MPI communicator data (e.g., the analysis
communicators discussed in Instantiating the strategy), DirectApplicInterface::analysisDrivers provides the anal-
ysis driver names specified by the user in the input file, and DirectApplicInterface::analysisComponents provides
additional analysis component identifiers (such as mesh file names) provided by the user which can be used to
distinguish different instances of the same simulation interface. It is worth noting that inherited attributes that are
set as part of the parallel configuration (instead of being extracted from the ProblemDescDB) will be set to their
defaults following construction of the base class instance for the derived class plug-in. It is not until run-time (i.e.,
within derived_map_if/derived_map_ac/derived_map_of) that the parallel configuration settings are repopulated
to the plug-in instance. This is the reason that the analysis communicator should be passed in to the constructor
of a parallel plug-in, if the constructor will be responsible for parallel application initialization.

### 12.7 Additional updates

As part of strategy instantiation, all problem specification data is extracted from ProblemDescDB as various ob-
jects are constructed. Therefore, any updates that need to be performed following strategy instantiation must be
performed through direct set operations on the constructed objects. In the previous section, the process for updat-
ing the Interface object used within a Model was shown. To update other data such as variable values/bounds/tags
or response bounds/targets/tags, refer to the set functions documented in Iterator and Model. As an example,
the following code updates the active continuous variable values, which will be employed as the initial guess for
certain classes of Iterators:

Modellist& all_models = problem_db.model_list();
Model& first_model = *all_models.begin();
Dakota::RealVector drv(1000, 1.); // vector of length 1000, values initialized to 1.
first_model.continuous_variables(drv);
Finally, with simulation configuration and plug-ins completed, we execute the strategy:

```cpp
// run the strategy
selected_strategy.run_strategy();
```

### 12.9 Retrieving data after a run

After executing the strategy, final results can be obtained through the use of `Strategy::variables_results()` and `Strategy::response_results()`, e.g.:

```cpp
// retrieve the final parameter values
const Variables& vars = selected_strategy.variables_results();

// retrieve the final response values
const Response& resp = selected_strategy.response_results();
```

In the case of optimization, the final design is returned, and in the case of uncertainty quantification, the final statistics are returned.

### 12.10 Linking against the DAKOTA library

This section presumes DAKOTA has been compiled and installed to `PREFIX` using 'make install’. While the DAKOTA build system offers the most up-to-date guidance for what libraries are needed to link against a particular version of DAKOTA, a typical case is presented here. Note that depending on how you configured DAKOTA, some of the following libraries may not be available (for example NPSOL, DOT, NLPQL) – check which appear in `$PREFIX/lib`. Also as of DAKOTA 4.2, the link process is not as sensitive to order of these libraries, with the possible exception of liblhs.a.

As of DAKOTA 5.0, `-levidence` is no longer required and `-lgsl` is optional (discouraged due to GPL), depending on how DAKOTA was configured.

Post DAKOTA 5.0, `-lquadrature` has been renamed to `-lsparsegrid`. Also the DFFTPACK library should be integrated into libpecos, so `-ldfftpack` should not be needed and NKM should be integrated into libsurfpack, so `-lnkm` should not be needed.

```bash
DAKOTA_LIBS = -L${PREFIX}/lib -ldakota -lteuchos -lpecos -llhs -lparsegrid -lsparsepack -lconmin -lddace -ldot -lsparsepack
             -lindr -lxml2 -lxml -llapack -lblas
```

You may also need `funcadd0.o`, `-lfl` and, if linking with system-provided GSL, `-lgslcblas`. The AMPL solver library may require `-ldl`. If configuring with graphics, you will need to add `-lDGraphics` and system X libraries (partial list here):

```bash
-lXpm -lXm -lXt -lXmu -lXp -lXext -lX11 -lSM -lICE
```
We have experienced problems with the creation of libamplsolver.a on some platforms. Please use the DAKOTA mailing lists for help with any problems.

Finally, it is important to use the same C++ compiler (possibly an MPI wrapper) for compiling DAKOTA and your application and declare the compiler define -DHAVE_CONFIG_H when including header files from DAKOTA. This ensures that the platform configuration settings are properly propagated.

12.11 Summary

To utilize the DAKOTA library within a parent software application, the basic steps of main.C and the order of invocation of these steps should be mimicked from within the parent application. Of these steps, ParallelLibrary instantiation, ProblemDescDB::manage_inputs() and ParallelLibrary::specify_outputs_restart() require the use of overloaded forms in order to function in an environment without direct command line access and, potentially, without file parsing. Additional optional steps not performed in main.C include the extension/derivation of the direct interface and the retrieval of strategy results after a run.

DAKOTA’s library mode is now in production use within several Sandia and external simulation codes/frameworks.
Chapter 13

Performing Function Evaluations

Performing function evaluations is one of the most critical functions of the DAKOTA software. It can also be one of the most complicated, as a variety of scheduling approaches and parallelism levels are supported. This complexity manifests itself in the code through a series of cascaded member functions, from the top level model evaluation functions, through various scheduling routines, to the low level details of performing a system call, fork, or direct function invocation. This section provides an overview of the primary classes and member functions involved.

13.1 Synchronous function evaluations

For a synchronous (i.e., blocking) mapping of parameters to responses, an iterator invokes `Model::compute_response()` to perform a function evaluation. This function is all that is seen from the iterator level, as underlying complexities are isolated. The binding of this top level function with lower level functions is as follows:

- `Model::compute_response()` utilizes `Model::derived_compute_response()` for portions of the response computation specific to derived model classes.
- `Model::derived_compute_response()` directly or indirectly invokes `Interface::map()`.
- `Interface::map()` utilizes `ApplicationInterface::derived_map()` for portions of the mapping specific to derived application interface classes.

13.2 Asynchronous function evaluations

For an asynchronous (i.e., nonblocking) mapping of parameters to responses, an iterator invokes `Model::asynch_compute_response()` multiple times to queue asynchronous jobs and then invokes either `Model::synchronize()` or `Model::synchronize_nowait()` to schedule the queued jobs in blocking or nonblocking fashion. Again, these functions are all that is seen from the iterator level, as underlying complexities are isolated. The binding of these top level functions with lower level functions is as follows:

- `Model::asynch_compute_response()` utilizes `Model::derived_asynch_compute_response()` for portions of the response computation specific to derived model classes.
• This derived model class function directly or indirectly invokes Interface::map() in asynchronous mode, which adds the job to a scheduling queue.

• Model::synchronize() or Model::synchronize_nowait() utilize Model::derived_synchronize() or Model::derived_synchronize_nowait() for portions of the scheduling process specific to derived model classes.

• These derived model class functions directly or indirectly invoke Interface::synch() or Interface::synch_nowait().

For application interfaces, these interface synchronization functions are responsible for performing evaluation scheduling in one of the following modes:

– asynchronous local mode (using ApplicationInterface::asynchronous_local_evaluations() or ApplicationInterface::asynchronous_local_evaluations_nowait())

– message passing mode (using ApplicationInterface::self_schedule_evaluations() or ApplicationInterface::static_schedule_evaluations() on the iterator master and ApplicationInterface::serve_evaluations_synch() or ApplicationInterface::serve_evaluations_peer() on the servers)

– hybrid mode (using ApplicationInterface::self_schedule_evaluations() or ApplicationInterface::static_schedule_evaluations() on the iterator master and ApplicationInterface::serve_evaluations_asynch() on the servers)

• These scheduling functions utilize ApplicationInterface::derived_map() and ApplicationInterface::derived_map_asynch() for portions of asynchronous job launching specific to derived application interface classes, as well as ApplicationInterface::derived_synch() and ApplicationInterface::derived_synch_nowait() for portions of job capturing specific to derived application interface classes.

### 13.3 Analyses within each function evaluation

The discussion above covers the parallelism level of concurrent function evaluations serving an iterator. For the parallelism level of concurrent analyses serving a function evaluation, similar schedulers are involved (ForkApplicInterface::synchronous_local_analyses(), ForkApplicInterface::asynchronous_local_analyses(), ApplicationInterface::self_schedule_analyses(), ApplicationInterface::serve_analyses_synch(), ForkApplicInterface::serve_analyses_asynch()) to support synchronous local, asynchronous local, message passing, and hybrid modes. Not all of the schedulers are elevated to the ApplicationInterface level since the system call and direct function interfaces do not yet support nonblocking local analyses (and therefore support synchronous local and message passing modes, but not asynchronous local or hybrid modes). Fork interfaces, however, support all modes of analysis parallelism.
Chapter 14

Software Tools for DAKOTA Development

14.1 Introduction

DAKOTA development relies on Subversion for revision control and the GNU Autotools for configuration management. This section lists these tools, where to acquire recommended versions, and how to configure them.

14.2 Subversion for Version Control

The DAKOTA project uses Subversion (http://subversion.apache.org/) for software revision control. To checkout DAKOTA it may be necessary to install or upgrade the Subversion client on your system.

As of October 2010, we require Subversion client version 1.6 or newer, due to need for file-based externals. We recommend using 1.6.13 source from http://subversion.tigris.org/downloads/subversion-1.6.13.tar.gz or binary packages available from http://subversion.apache.org/packages.html

To configure and build from source on your machine, the following settings should be used, since DAKOTA is hosted as a FSFS-type repository and numerous components are stored in a repository requiring SSL certificate handling:

```
SVNVER=1.6.13
wget http://subversion.tigris.org/downloads/subversion-$SVNVER.tar.gz
wget http://subversion.tigris.org/downloads/subversion-deps-$SVNVER.tar.gz
tar xzf subversion-$SVNVER.tar.gz
tar xzf subversion-deps-$SVNVER.tar.gz
cd subversion-$SVNVER
./configure --prefix=/apps/subversion/$SVNVER --with-ssl --without-berkeley-db CC=gcc CFLAGS=-O2 CXX=g++ CXXFLAGS=-O2
make -j 4 && make install
# ALT: make -j 4 && make check && make install
```

If you are an external developer, once Subversion is working, DAKOTA (including externals) can be checked out with the single command

```
```
If you are an internal developer, DAKOTA can be checked out with the single command

```
```

Note that authentication is required to check out the DAKOTA repository. Contact a member of the DAKOTA development team for more information.

If you experience server timeouts when SVN attempts to fetch external packages through a proxy server, you might need to make a change to your $HOME/.subversion/servers file (generated for you the first time you run svn) by adding

```
[global]
http-proxy-exceptions = localhost, *.intranet.mydomain.com
http-proxy-host = wwwproxy.mydomain.com
```

to the bottom of the file. You should no longer get server timeouts when getting acro from software.sandia.gov. If you find that checking these three packages out from software is unacceptably slow, you may add your hostname to the end of the http-proxy-exceptions line. Finally, svn will prompt you as to whether you wish to accept the SSL certificate from software; type 'p' for permanent.

To set the default editor for Subversion commits, you may add the following to .cshrc (or similar for .bashrc):

```
setenv EDITOR "xemacs -g 81X50"
```

Version Control with Subversion (http://svnbook.red-bean.com) is a great resource on SVN.

### 14.3 GNU Autotools for Configuration Management

DAKOTA uses the GNU Autotools (http://www.gnu.org/software/autoconf/) for configuration management. Autoconf-2.60 or newer is required. Developers are currently using the following versions (it is important to use compatible versions of all these tools), though some newer versions are reported to work as well:

1. m4-1.4.4 (http://ftp.gnu.org/gnu/m4/m4-1.4.4.tar.gz)
2. autoconf-2.60 (http://ftp.gnu.org/gnu/autoconf/autoconf-2.60.tar.gz)
3. automake-1.10.3 (http://ftp.gnu.org/gnu/automake/automake-1.10.3.tar.gz)
4. libtool-1.5.24 (http://ftp.gnu.org/gnu/libtool/libtool-1.5.24.tar.gz)

The following alternate tools versions may also work (use compatible versions as listed in a particular row):

<table>
<thead>
<tr>
<th>autoconf</th>
<th>m4</th>
<th>automake</th>
<th>libtool</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.65</td>
<td>21-Nov-2009</td>
<td>1.4.13</td>
<td>1.11.1</td>
</tr>
<tr>
<td>2.64</td>
<td>26-Jul-2009</td>
<td>1.4.13</td>
<td>1.11.1</td>
</tr>
<tr>
<td>2.63</td>
<td>09-Sep-2008</td>
<td>1.4.11</td>
<td>1.11.1</td>
</tr>
<tr>
<td>2.62</td>
<td>08-Apr-2008</td>
<td>1.4.11</td>
<td>1.11.1</td>
</tr>
<tr>
<td>2.61</td>
<td>17-Nov-2006</td>
<td>1.4.7</td>
<td>1.11.1</td>
</tr>
<tr>
<td>2.60</td>
<td>26-Jun-2006</td>
<td>1.4.4</td>
<td>1.10.3</td>
</tr>
</tbody>
</table>
Building the tools in the order listed above (m4, autoconf, automake, libtool) should satisfy dependencies if the newly installed tools are on your PATH. For each PACKAGE the following build process should suffice:

```
tar xzf $PACKAGE.tar.gz
cd $PACKAGE
./configure --prefix=$HOME/local
make
[make check]
make install
```
