SAND2004-4329P

Matching Supercomputing to Progress in Science

Erik P. DeBenedictis

Sandia National Laboratories

Sandia is a multiprogram laboratory operated by Sandia Corporation, a Lockheed Martin Company, for the United States Department of Energy's National Nuclear Security Administration under contract DE-AC04-94AL85000.

Sandia National Laboratories

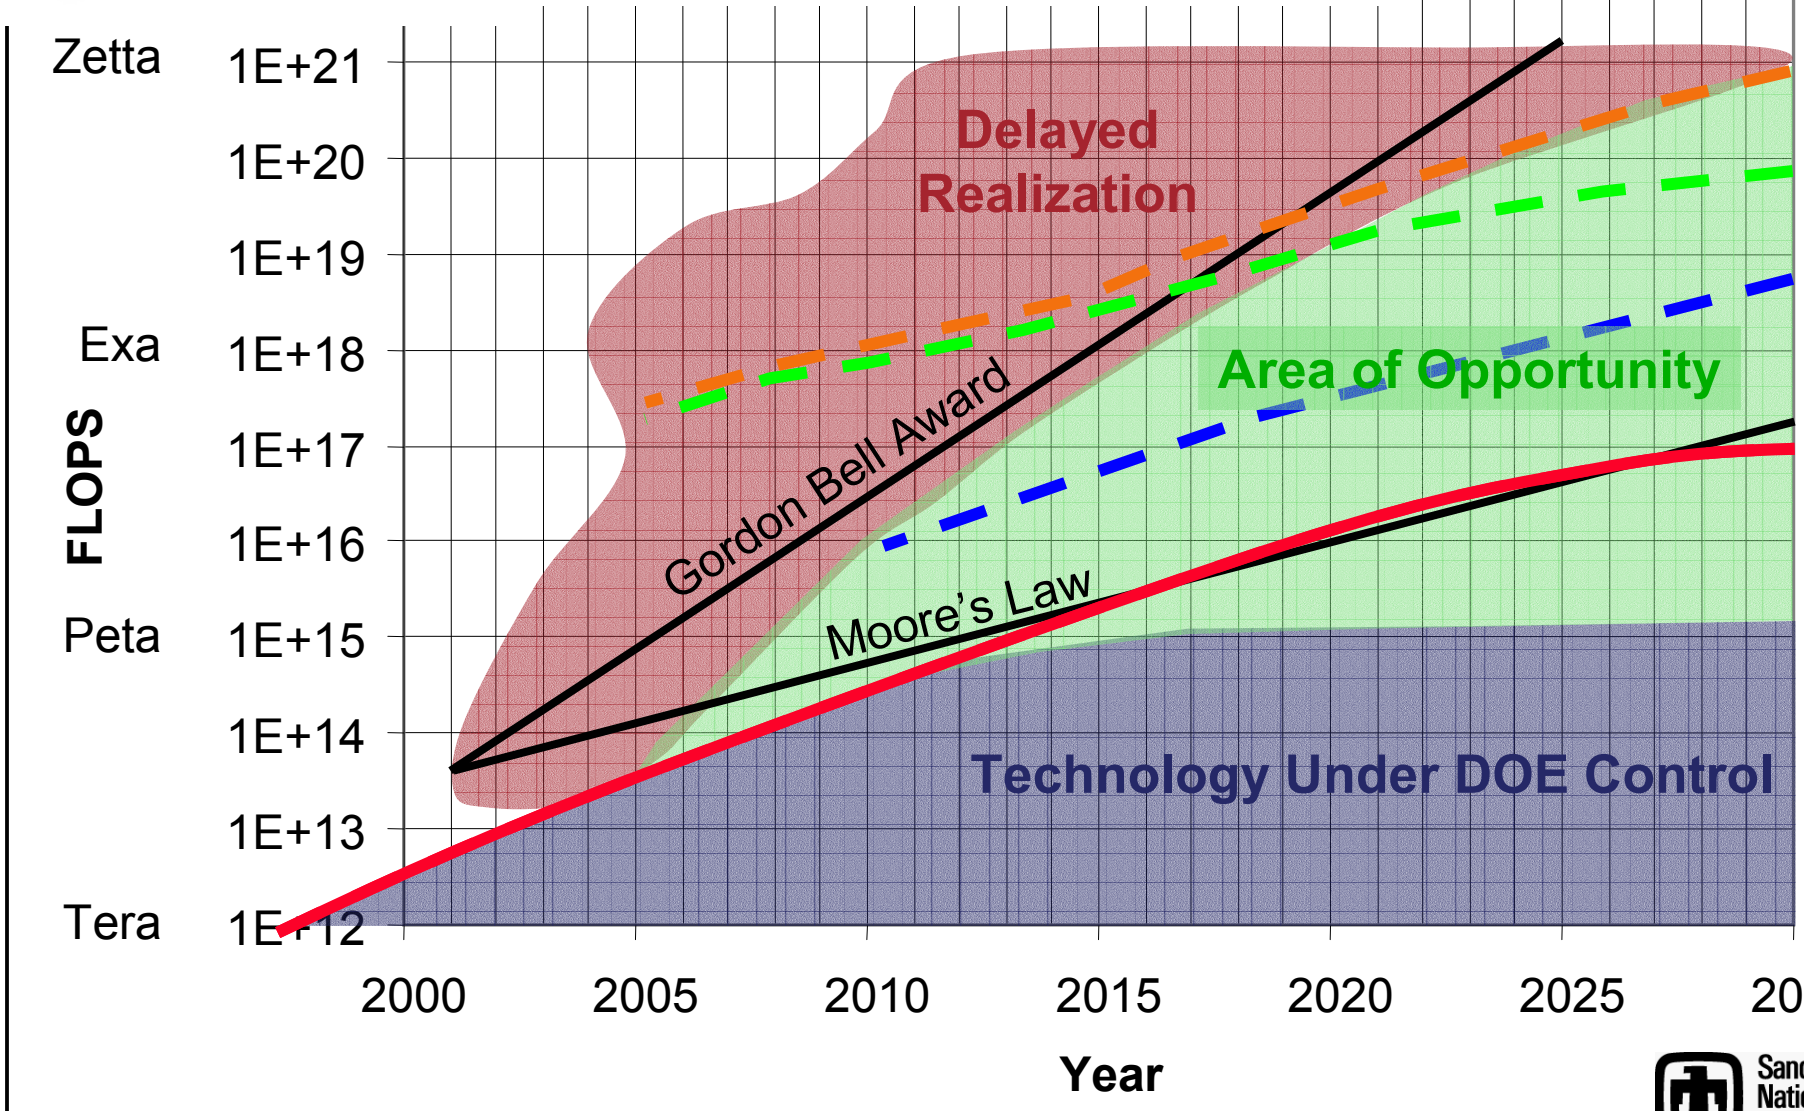
Introduction



Sandia National Laboratories

Outline

- Applications of the Future
- Limits of Moore's Law
- An Expert System/Optimizer for Supercomputing
- Reaching to Zettaflops
- Roadmap and Future Directions

Sandia National Laboratories

Global Climate

- Objective
  - Collect data about Earth
  - Model climate into the future
  - Provide “decision support” and ability to “mitigate”
- Approaches
  - Climate models exist, but need they more resolution, better physics, and better initial conditions (observations of the Earth)
- Computer Resources Required
  - Increments over current workstation on next slide

FLOPS Increases for Global Climate

	Issue	Scaling
1 Zettaflops	Ensembles, scenarios 10×	Embarrassingly Parallel
100 Exaflops	Run length 100×	Longer Running Time
1 Exaflops	New parameterizations 100×	More Complex Physics
10 Petaflops	Model Completeness 100×	More Complex Physics
100 Teraflops	Spatial Resolution $10^4\times$ ($10^3\times$-$10^5\times$)	Resolution
10 Gigaflops	Current

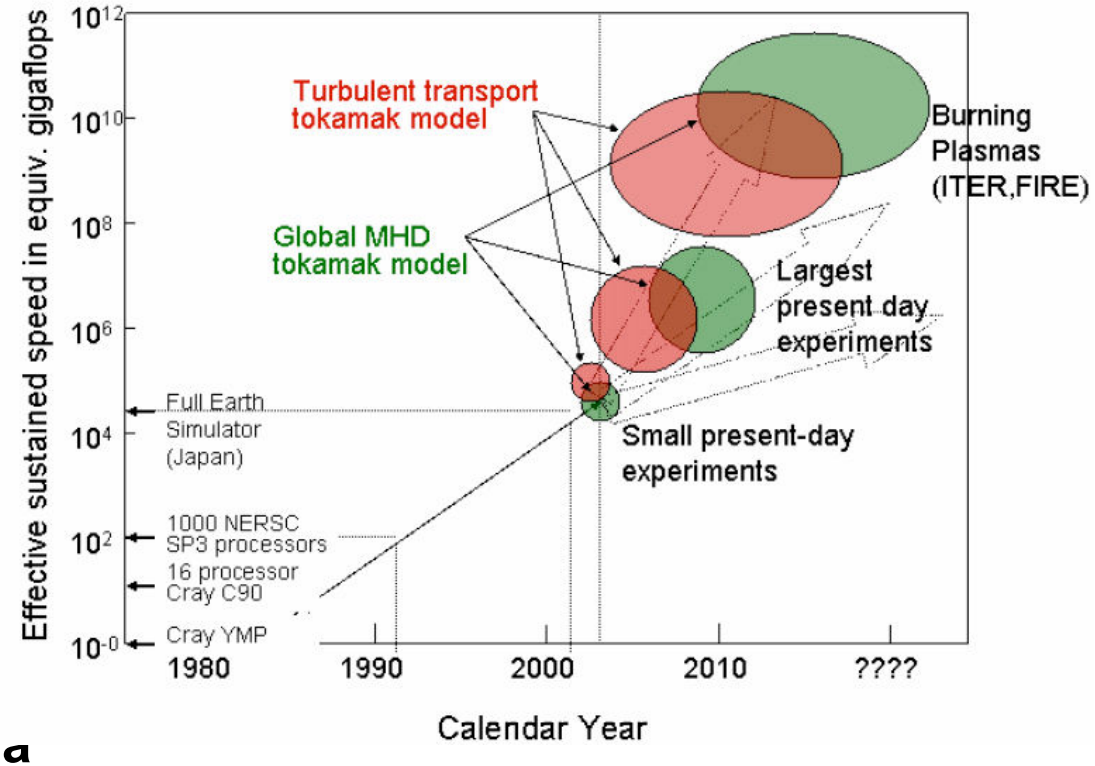
Sandia National Laboratories

Requirements for Plasma Simulation

- Very high peak perform ance requirements
  - but seeking algor- ithmic improvement
- Two methods
  - Red regions very scalable, Monte Carl
  - Green regions N^4 scaling (FEM)
- Long term objective
  - Merge methods into a single code



Ref. "Plasma Science Contribution to the SCaLeS Report," S.C. Jardin, October 2003

Sandia National Laboratories

NASA Climate Earth Station

Based on these inputs, various portions of the Modeling and Data Assimilation System will require anywhere from 10^7 to 10^{13} GFLOPS of computational resources. In other words, the range of computational resources needed is 10^{16} to 10^{21} Floating Point Operations per Second. For the curious, the range can also be stated as 10 PetaFLOPS to 1 ZettaFLOPS.

4.1.2. Anticipated Computing Technology Capabilities

At first glance, the numbers discussed in the previous section appear so high as to be impossibly ludicrous. However, with the expected growth in computing capabilities, the lower end of this spectrum actually falls within the domain of possibility.

Sandia National Laboratories

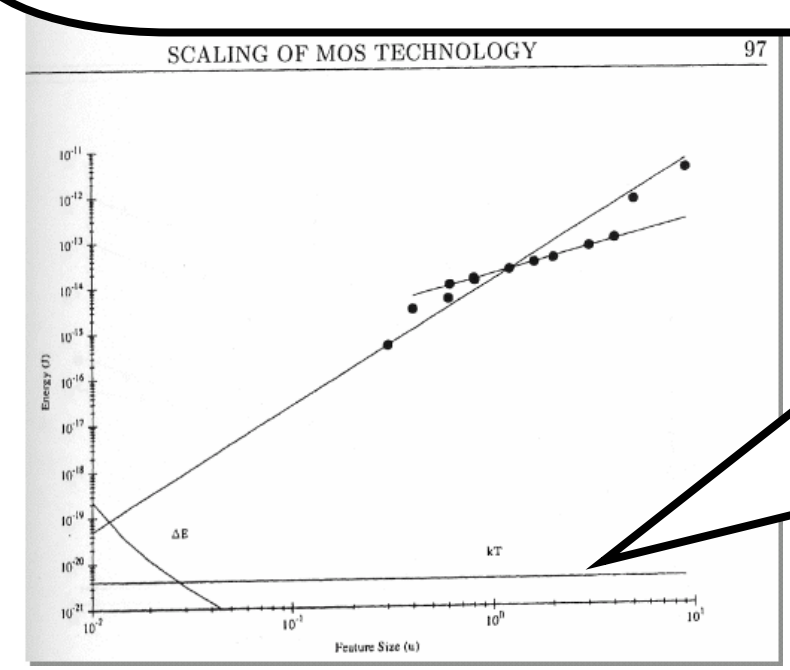
Thermal Noise Limit

This logical irreversibility is associated with physical irreversibility and requires a minimal heat generation, per machine cycle, typically of the order of kT for each irreversible function.
– R. Landauer 1961

Irreversibility and Heat Generation in the Computing Process



kT "helper line," drawn out of the reader's focus because it wasn't important at the time of writing
– Carver Mead, Scaling of MOS Technology, 1994

Sandia National Laboratories

Metaphor: FM Radio on Trip to Seattle

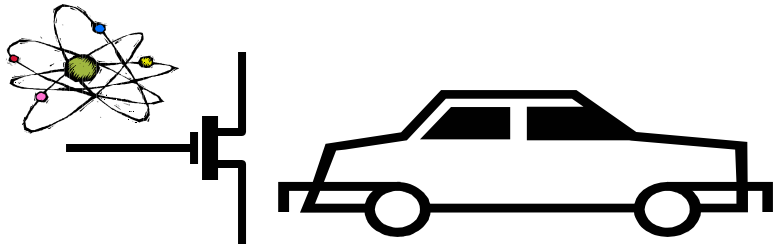
- You drive to Seattle listening to FM radio
- Music clear for a while, but noise creeps in and then overtakes music
- Analogy: You live out the next dozen years buying PCs every couple years
- PCs keep getting faster
  - clock rate increases
  - fan gets bigger
  - won't go on forever
- Why…see next slide

Details: Erik DeBenedictis, "Taking ASCI Supercomputing to the End Game," SAND2004-0959

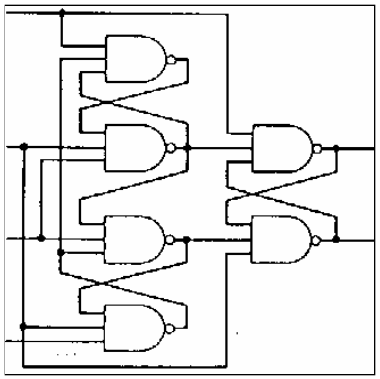
Sandia National Laboratories

FM Radio and End of Moore's Law

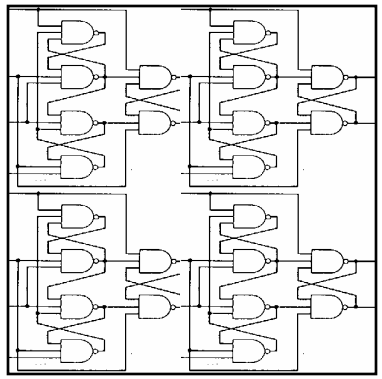
Distance



Driving away from FM transmitter→less signal
Noise from electrons → no change



Shrink



Increasing numbers of gates→less signal power
Noise from electrons → no change

Sandia National Laboratories

Amount of Reliability Needed

- We expect computers to be reliable
- A future supercomputer will perform 10^{30}-10^{40} operations in its lifetime
- Error rate should be < 10^{-30} - 10^{-40}
- Reliability due to thermal noise about $e^{-E/kt}$
- Need about e^{-100} error rate, or 100 k_BT switching energy

SNR (db)	Power Ratio	P_{error}
10	10	3.9×10^{-6}
14	25	6.8×10^{-13}
18	63	1.4×10^{-29}
22	160	3.3×10^{-71}
26	400	1.8×10^{-175}
30	1,000	4.5×10^{-437}
34	2,500	7.1×10^{-1094}
38	6,300	2.2×10^{-2743}
42	16,000	1.8×10^{-6886}
46	40,000	3.8×10^{-17293}
50	100,000	3.2×10^{-43433}
54	250,000	8.1×10^{-10194}
58	630,000	1.8×10^{-274025}
62	1,500,000	9.6×10^{-688315}

Noise Limit

2016

Today

$$q := \int_t^{\infty} \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx;\ t \to \sqrt{2 * 10^{\frac{snr}{10}}}$$

Sandia National Laboratories

Noise Levels

- 0 db Limit of hearing
- 20 db Rustling leaves
- 40-50 db Typical neighborhood
- 60-70 db Normal conversation
- 80 db Telephone dial tone
- 85 db City traffic inside car
- 90 db Train whistle @500’
- 95 db Subway train @200’
- 90-95 db Ear damage

- Today: 50 db
  - Thermal noise:Logic:: Rustling leaves:Talking
- 2016: 30 db
  - Thermal noise:Logic:: Talking:Train Whistle
- Reliability limit 20 db
  - Thermal noise:Logic:: Outside neighborhood:Talking

Sandia National Laboratories

Personal Observational Evidence

- Have radios become better able to receive distant stations over the last few decades with a rate of improvement similar to Moore's Law?
- You judge from your experience, but the answer should be that they have not.
- Therefore, electrical noise does not scale with Moore's Law.

Sandia National Laboratories

SIA Semiconductor Roadmap

- Generalization of Moore's Law
  - Projects many parameters
  - Years through 2016
  - Includes justification
  - Panel of experts
    - known to be wrong
  - Size between Albuquerque white and yellow pages

International Technology Roadmap for Semiconductors (ITRS), see http://public.itrs.net

Sandia National Laboratories

Expert System for Future Supercomputers

- Applications Modeling
  - Runtime
    $T_{run} = f_1(n, design)$
- Technology Roadmap
  - Gate speed = $f_2(year)$,
  - chip density = $f_3(year)$,
  - cost = $(n, design), …
- Scaling Objective Function
  - I have $\$C_1$ & can wait $T_{run}=C_2$ seconds. What is the biggest n I can solve in year Y?

- Use "Expert System" To Calculate:

$$\max_{\text{All designs}} n: \$<C_1,\ T_{run}<C_2$$

- Report:

$$\frac{\text{Floating operations}}{T_{run}(n, design)}$$

and illustrate "design"

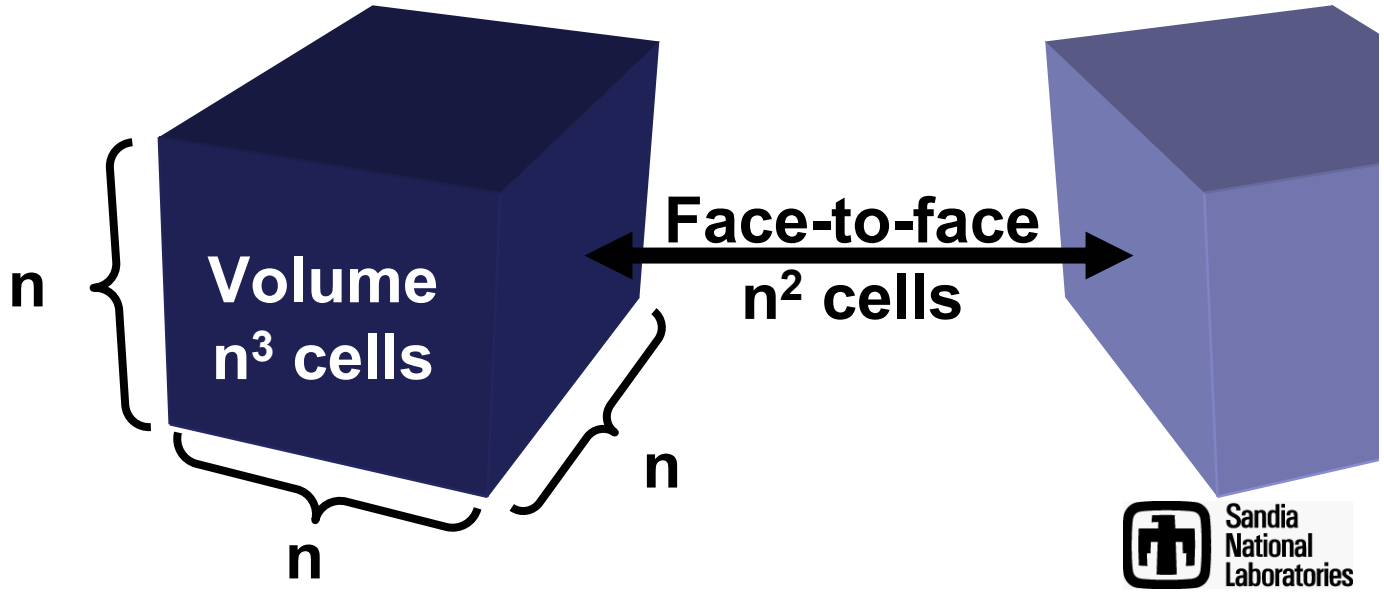
Sandia National Laboratories

Analytical Runtime Model

- Simple case: finite difference equation
- Each node holds n×n×n grid points

- Volume-area rule
  - Computing ∝ n^3
  - Communications ∝ n^2

$$T_{step} = 6\, n^2\, C_{bytes}\, T_{byte} + n^3\, F_{grind}/floprate$$



Sandia National Laboratories

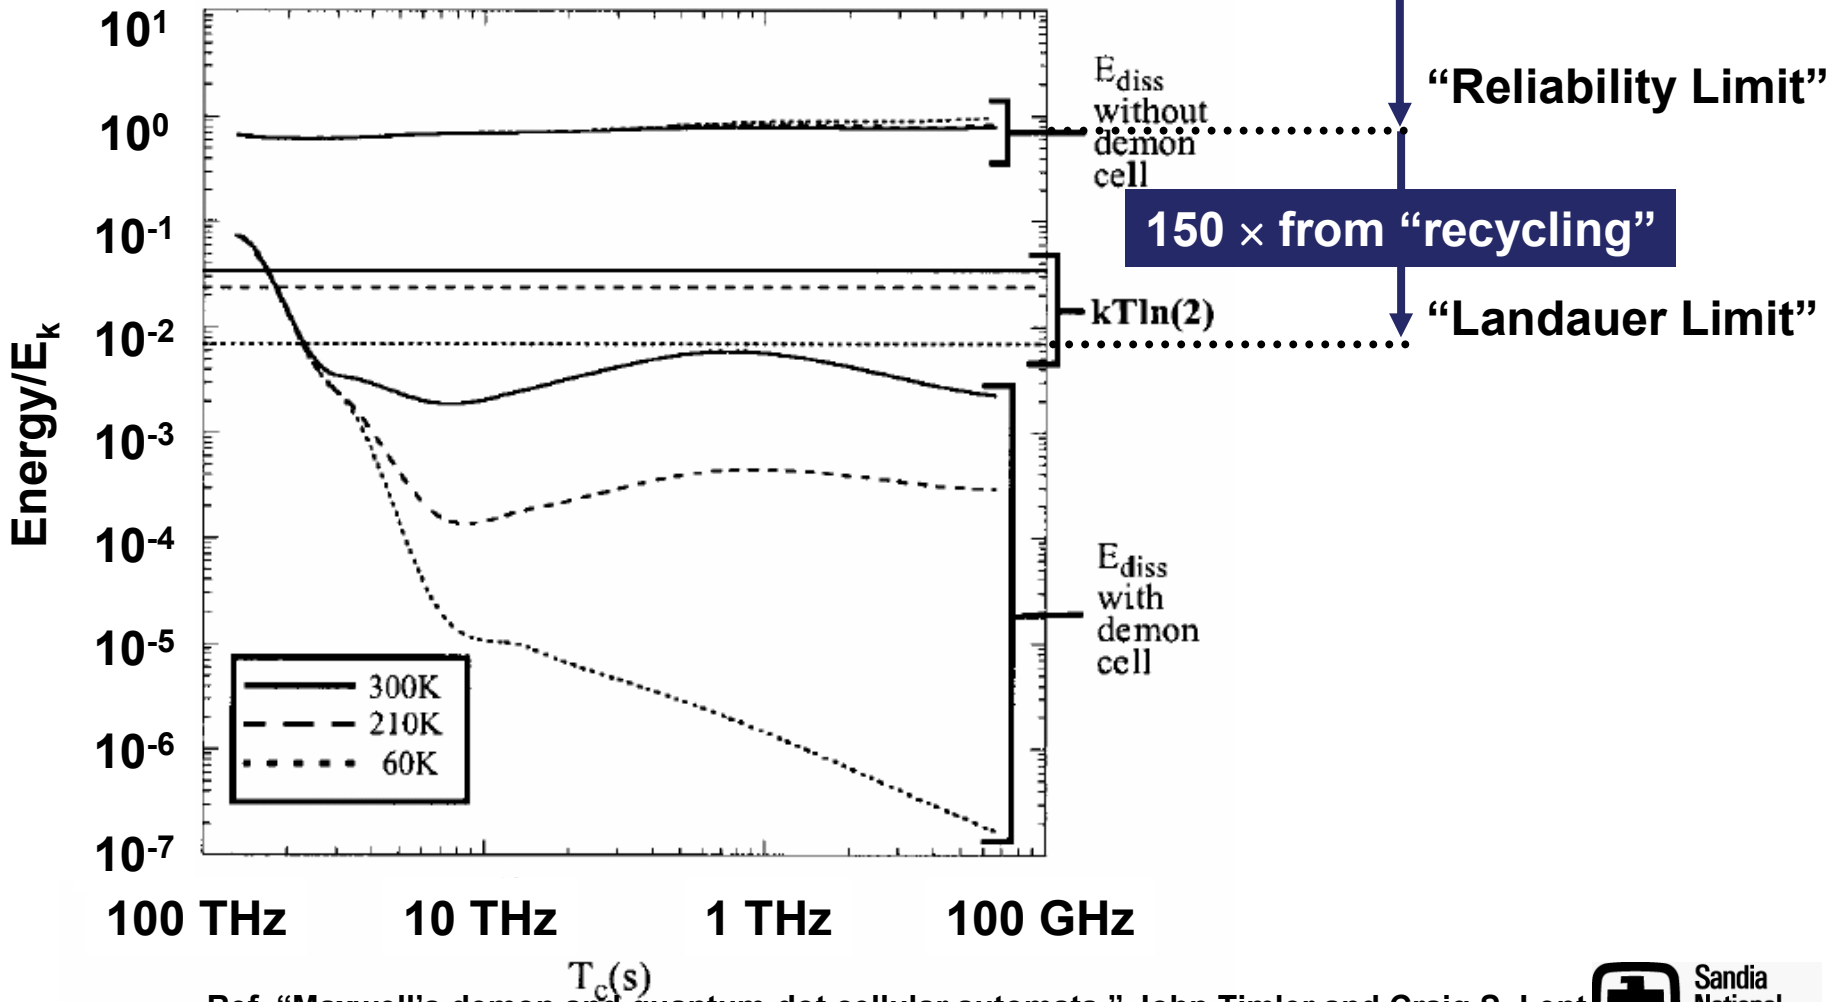
Step 2: Energy Recycling



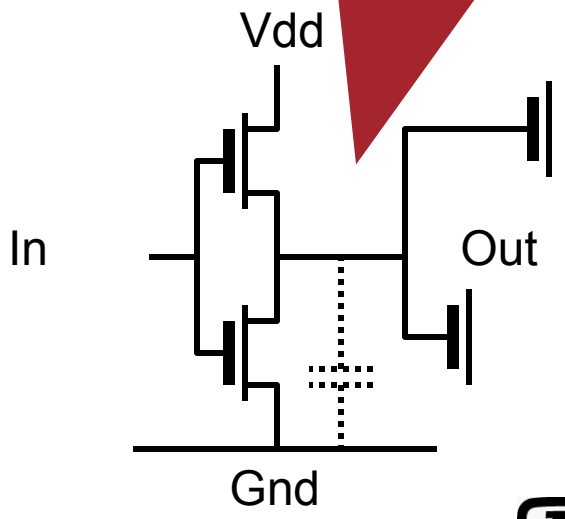
Ref. "Maxwell's demon and quantum-dot cellular automata," John Timler and Craig S. Lent, JOURNAL OF APPLIED PHYSICS 15 JULY 2003

Sandia National Laboratories

Today's Universal Logic & Reliability Limit

- Today's logic operates on a simple principle
  - Create a "1" by taking charge from the positive supply
  - Create a "0" by sending charge to the negative supply
- Energy Consumption
  - Each gate switch generates $E_{sw} = \frac{1}{2} CV^2 > \sim 100 k_B T$ heat

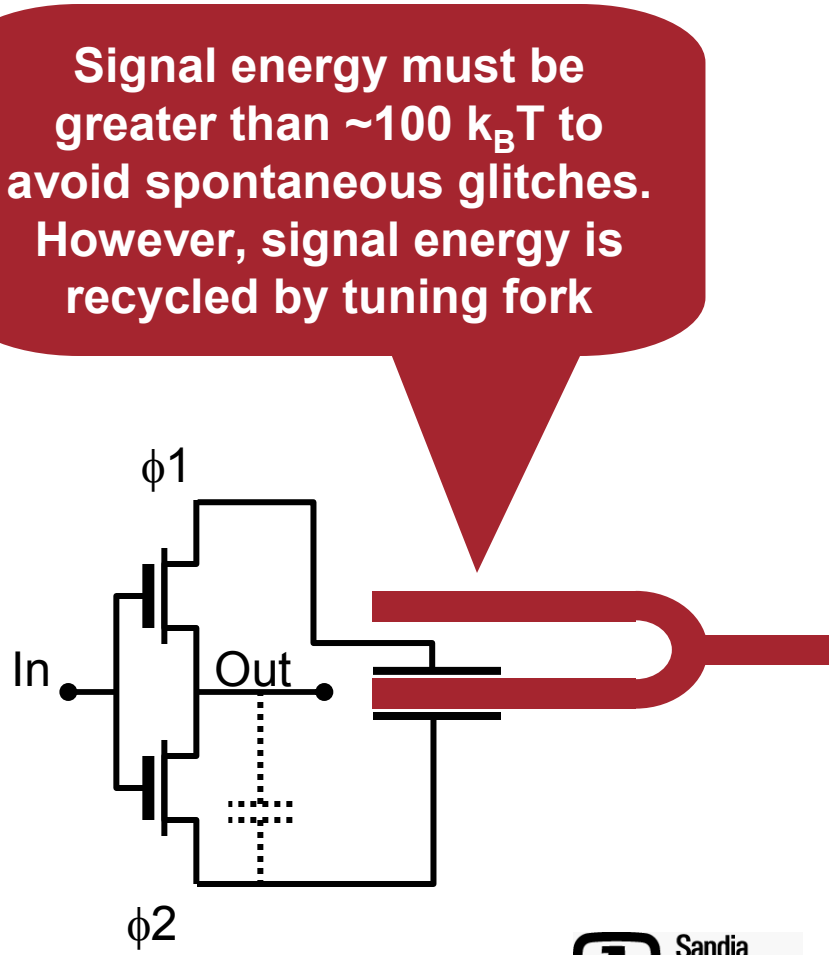
Signal energy must be greater than ~100 $k_B T$ to avoid spontaneous glitches. To change a bit, convert energy to heat.



Sandia National Laboratories

“Recycling” Power

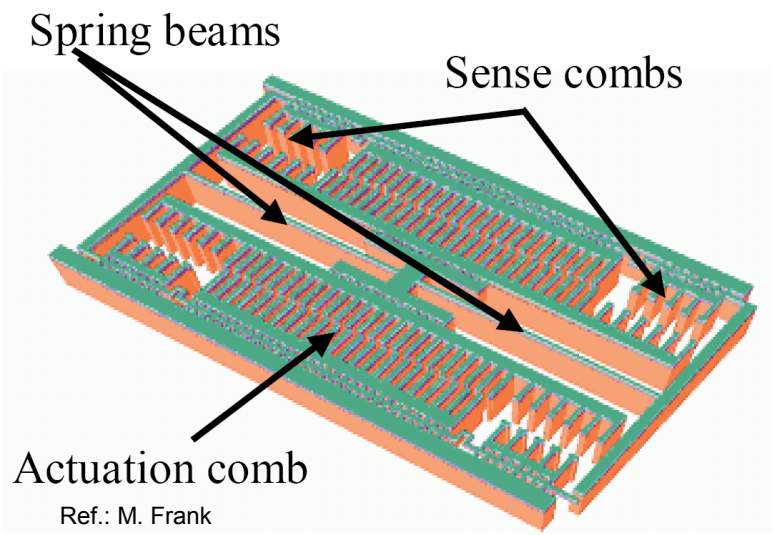
- The 100k_BT limit appears unbeatable, but the energy can be “recycled”
- Diagram shows a “SCRL” circuit with regular transistors
- Power comes through a largely loss less resonant device (tuning fork)
- No apology offered for the mechanical device; this is the price of progress



Sandia National Laboratories

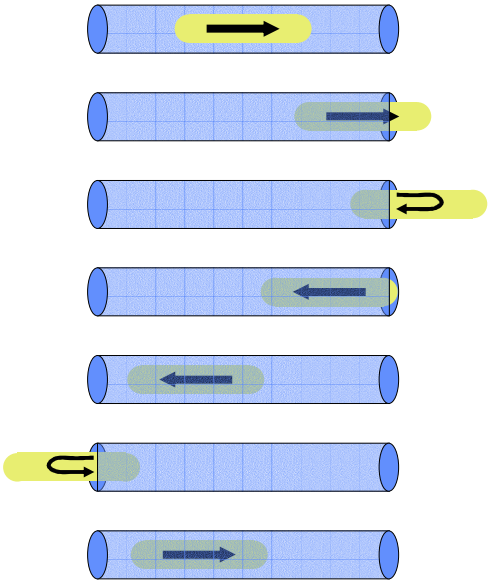
Resonant Clocks

- **Tuning Fork**
  - **Nice idea but slow**
- **MEMs Resonator**
  - **Moderate speed and compatible with silicon fabrication**



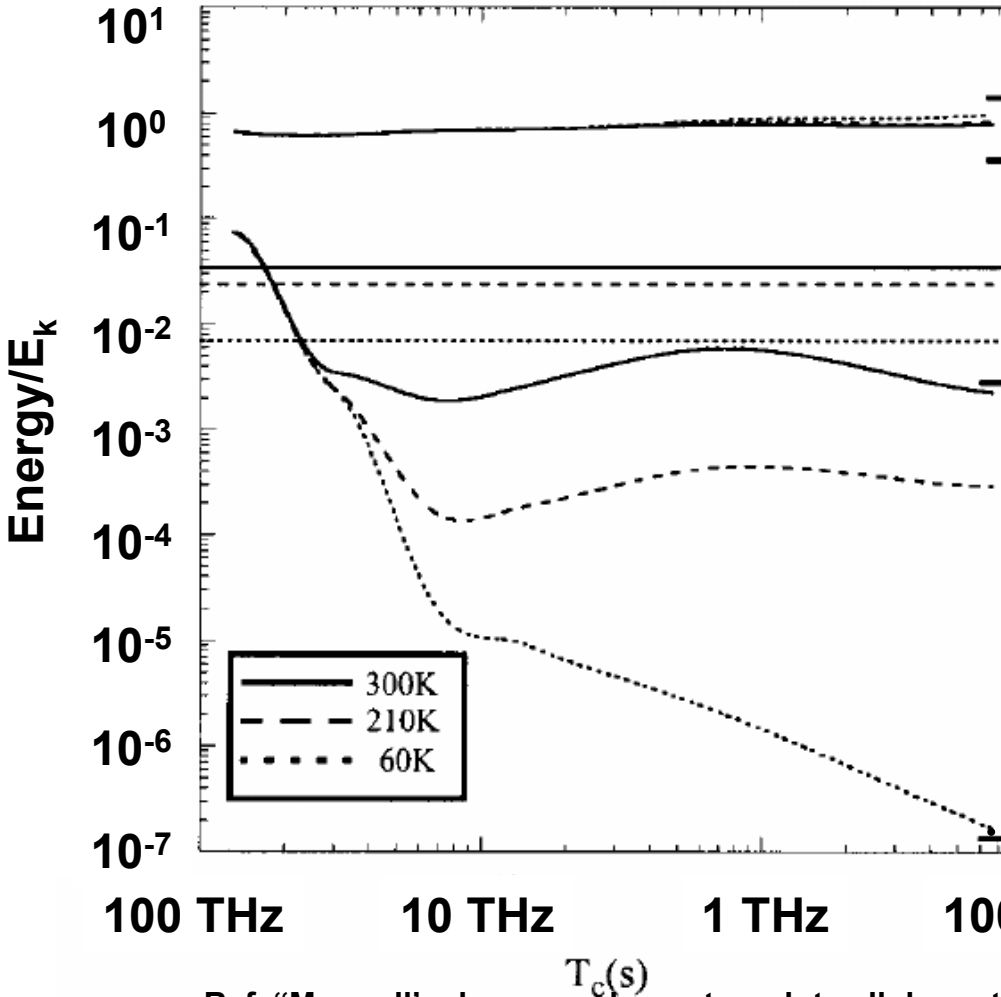
Ref.: M. Frank

- **Carbon Nanotube**
  - **Simulated to 50 GHz but not known how to fabricate at present**



Sandia National Laboratories

Step 3: Reversibility & New Devices



2004 Device Level

1000 ×

"Reliability Limit"

150 ×

"Landauer Limit"

>10^4 × Reversible Logic & Post-Transistor devices

Dissipation for reversible operations

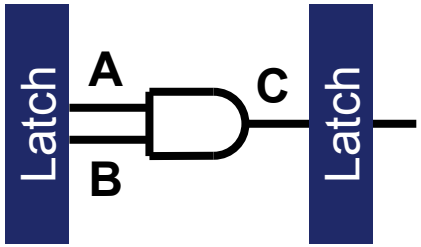
Sandia National Laboratories

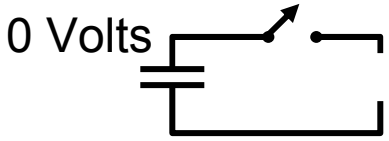
How Much Heat to Discharge a Capacitor?



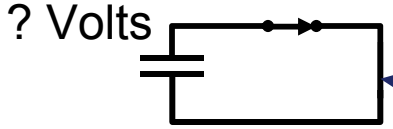
- **At some point it will be necessary for signals A and B to change to some new values**
- **We can avoid generating heat if we know the previous value**

If charged:

If discharged:



If state unknown:

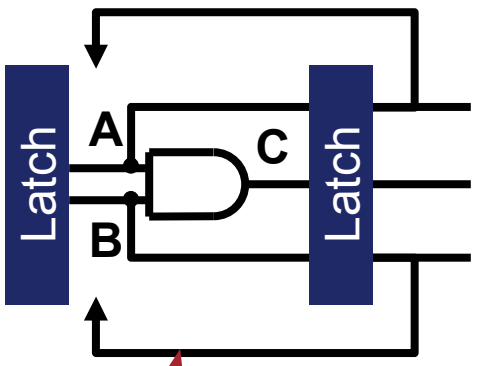


Short Circuit & Heat

Sandia National Laboratories

Reversible Gates

- If we save the state of every signal, we can discharge the capacitors associated with signals without heat
- There are also gates where the state is not saved but can be reconstructed
  - Fredkin, Toffoli, CNOT
- However, this causes an increase in the number of signals

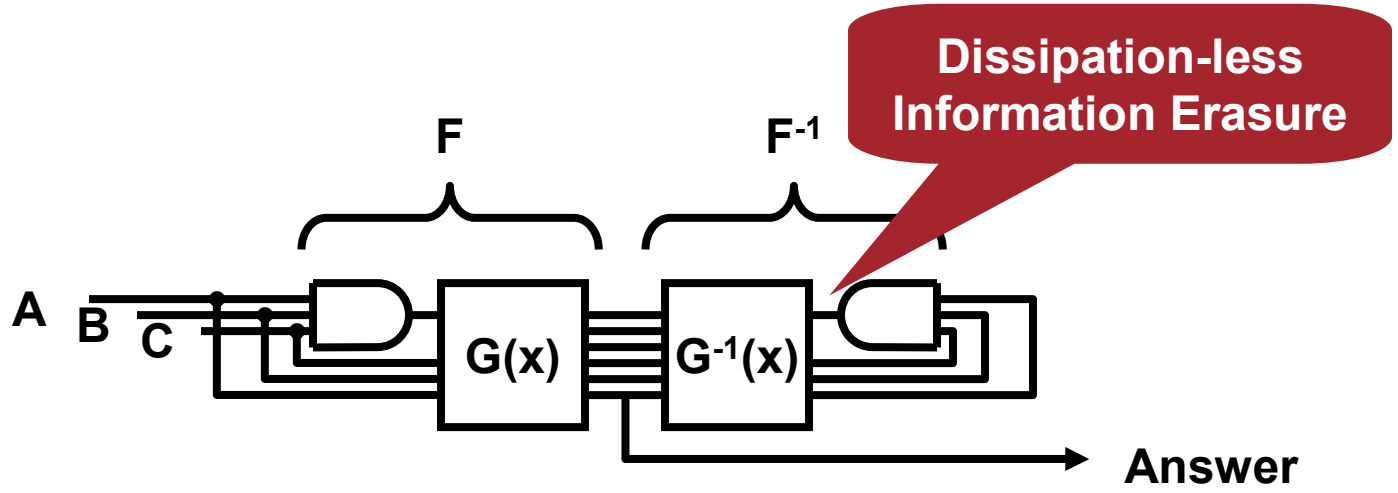


Signal tells us current state of B, permitting discharge without heat generation

Sandia National Laboratories

Reversible Logic Design

- Any function can be made reversible by saving its inputs, but this increases the number of signals
- Diagram below outlines an asymptotically zero-energy way to perform the AND function, in composition with other logical operations



Sandia National Laboratories

Two Key Points About Reversible Logic

- You saw a chart showing 10^5-10^7 improvement in power performance due to reversibility
- Reversible logic design principles are different from today's logic
  - It will be unfamiliar to today's engineers
  - Many design tools will require rewriting

Sandia National Laboratories

Reversible Multiplier Status

- 8×8 Multiplier Designed, Fabricated, and Tested by IBM & University of Michigan
- Power savings was up to 4:1

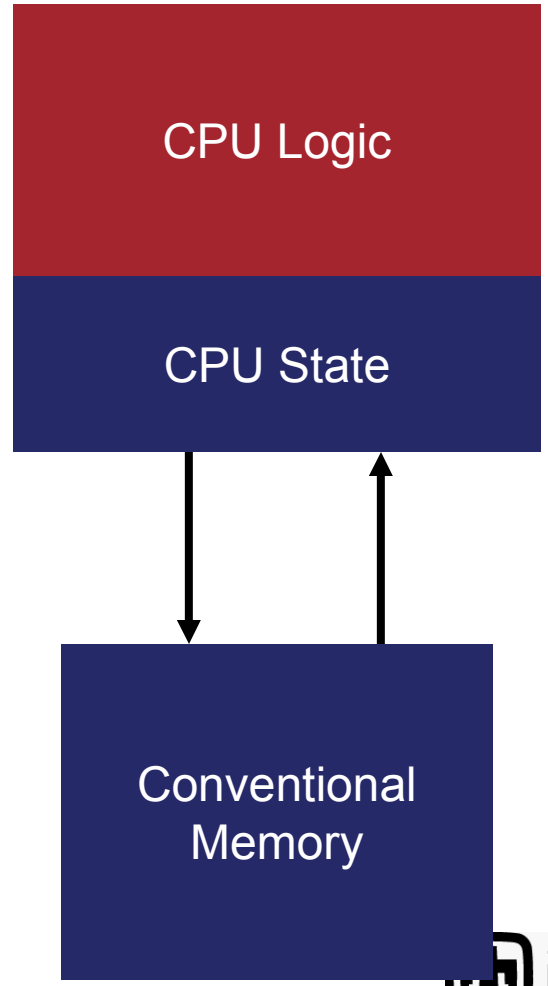
ABSTRACT

test chip.

CPU Design

- **Leading Thoughts**
  - **Implement CPU logic using reversible logic**
    - **High efficiency for the component doing the most logic**
  - **Implement state and memory using conventional logic**
    - **Low efficiency, but not many operations**
  - **Permits programming much like today**



Sandia National Laboratories

Reversible Microprocessor Status

- Status
  - Subject of Ph. D. thesis
  - Chip laid out (no floating point)
  - RISC instruction set
  - C-like language
  - Compiler
  - Demonstrated on a PDE
  - However: really weird and not general to program with +=, -=, etc. rather than =

National Laboratories

Outline

- Applications of the Future
- Limits of Moore's Law
- An Expert System/Optimizer for Supercomputing
- Reaching to Zettaflops
- Roadmap and Future Directions

Sandia National Laboratories

Conclusions

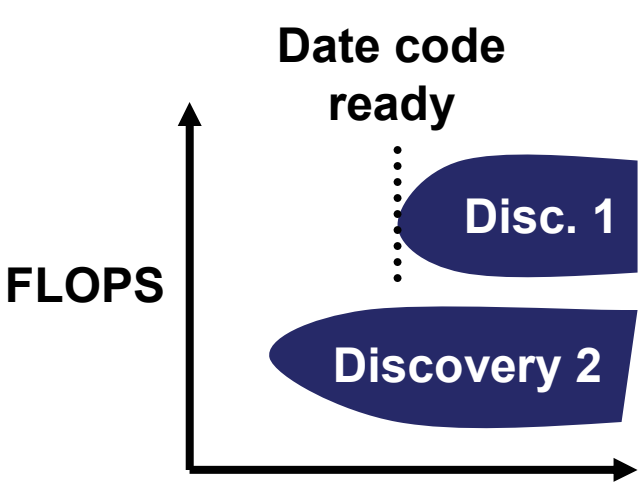
- A review of key problems in science that can be solved with supercomputers reveals a continuum of FLOPS “demand” up to 1 Zettaflops
- A review of “the physics of computation” reveals a progression of technologies offering a progressively larger “supply” of FLOPS for up to at least 1 Zettaflops
- Supply and demand are thus about the same

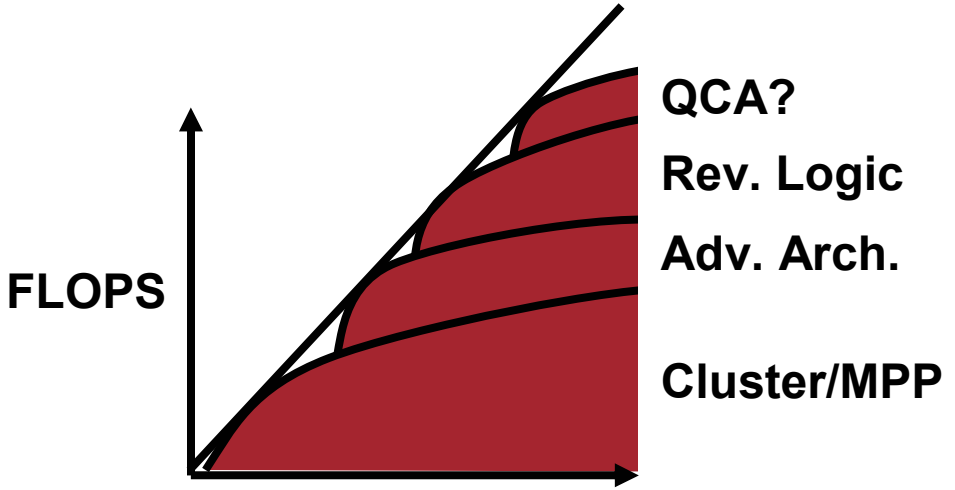
Sandia National Laboratories

Where to Go Next I: Workshop

- Don’t believe me? Believe the Experts
- Workshop Agenda October
  - Applications session – Climate expert Phil Jones
  - Advanced Architectures – PIM expert Peter Kogge
  - Limits of Current Architectures – Me
  - Limits Panel I: Limits of Current Technology
  - New Logic – Reversible Logic Expert Michael Frank
  - New Devices – Quantum Dot Developer Craig Lent
  - Limits Panel II: Opportunities with Innovation

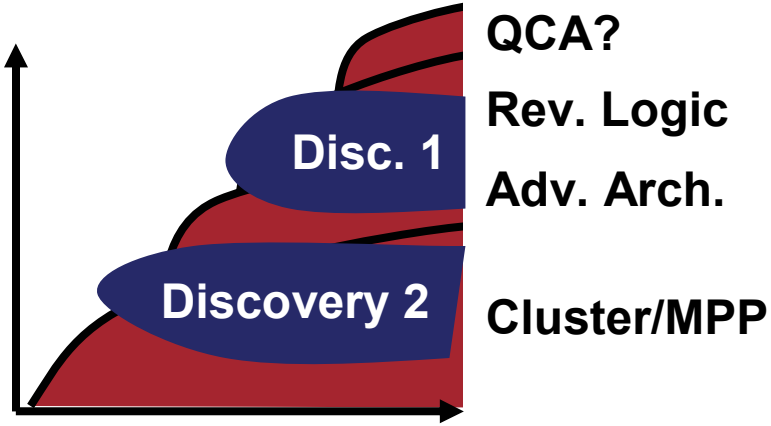
Where To Go Next II: Roadmap

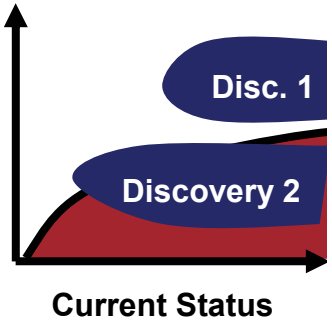




Notes:

* Not necessarily one machine; different applications may require different machines
* Specifics are just my ideas





Sandia National Laboratories

Where to Go Next III: PNNL Can Help

- What is the largest FLOPS rate that can be justified on the basis of scientific discovery for PNNL applications?
  - Not exactly for today's applications, but for scaled up problems of the same type
  - If your answer is
    - < 1 Zettaflops: you will be in good company
    - > 1 Zettaflops, you can be the high performance leader!
- This information would be helpful in justifying increasingly powerful supercomputers and planning scientific discoveries

Sandia National Laboratories
